Yes, I read the comment pretty much as "no new hardware is supported
by Linux; the support comes only later if at all" ;)

It seems to depend quite a lot about the manufacturer; eg. nVidia and
3Com seem to have rather quick support for Linux, whereas some
companies seem to be a real pain in the ass with support lagging years
or infinitely.

Hello!

I'm looking for a good Atari XL disassembler for the PC under Windows 98
(loading ATR-files and disassemble them on PC). I know there exist at
least one disassembler, but I forgot its name and URL. So, please help!

Andre

The first public version is out. Check it out at

http://pocketatari.retrogames.com

I also uploaded some screenshots showing my on-screen
keyboard implementation -- that may be useful for other
PDA ports.

My port supports both portrait and landscape mode. Landscape
is 320x240 without any image distortion. In portrait mode the
screen is 240x240 (square!), shrunk horizontally with pixel skip.
Interestingly enough, many games look actually better with this
broken aspect ratio.

Why buy a $300 NEW computer when for that amount of money you could get a very good USED computer? If you added an office suite, a VGA monitor connector and a printer to the Sega Dreamcast (which already has a browser, modem and keyboard available), there's a cheap combo with great games!

A decade from now $300 may be the standard price for a computer with relatively new technology, but the price today is more like $800-1000.

Realistically, you would have to be able to produce a $300 machine for about $50-70 to count in all the other costs, like shipping and returns, so someone would have to think outside the box, so to speak, to get the job done.

I do NOT think a monitor should be included with it. It adds weight and cost. You go to a thrift store and there are lots of monitors there. People also have TVs. The computer should have connections for at least types of monitors: SVGA, RCA and AV for TV/VCR. People can get whatever type of monitor they want.

I also think the day of the all-in-one desktop unit (the Apple IIc, Atari 800, Commodore 64 etc.) should be revived if one wants to be economical. Have a serial printer port, joystick/mouse port, the aforementioned three monitor/TV ports, SCSI port. Built in would be a 33k modem and 3.5 floppy drive for data storage. I wouldn't include CD-Rom. All the necessary stuff should be pre-installed to make life easy.

There would have to be a GUI. Something tight that doesn't slow down the new user. HD let's peg at 1GB and Ram at 64MB and figure the processor is 333 MHZ -- good enought to make the Net move but cheap by today's standards. The builder should work a deal with Lotus or WordPerfect to put a low-priced office suite on here.

These $300 machine won't compete speedwise with their $800 counterparts, but are GOOD ENOUGH for most users. And as the $800 machines get faster/better, so will the $300 machines due to trickle-down technology. Perhaps they will be five years behind the more expensive machines in bits and bytes.

That's my biz plan.

:) We're talking about Microsoft, and you can use Microsoft as your
example of precidence? "Microsoft can be a monopololy even though there
are choices, take Microsoft for instance?"

> And most users *didn't* get a choice, because
> of the licensing agreements with major PC manufacturers which is how a
> lot of people buy hardware.

They chose to buy a PC with Windows on it, they had a choice. If anyone
here can find me a PC they want, and they don't want Windows on it, I
guarantee I can find it somewhere else, with the same warranty, support,
and hardware, at the same price, with another OS on it.

Even during the time when Microsoft had exclusive licensing clauses
(ended around 1993) there were options. I mean, heck, look at this
newsgroup.

Do you really think that everyone with windows on their computer was
forced to use it? I guarantee if you take a poll and ask people buying
new machines, and ask them what OS they want on their new PC, it will be
Windows. The people who want something else will buy a machine without
Windows. (Personally I've never purchased Windows, but I get developer
versions via MSDN, and beta versions like the XP I'm using now)

Here's the real world situation. Microsoft can't touch Apache with IIS
in any of it's incarnations, and it doesn't look like that will change,

despite the fact they'll give it to you FREE with Server, and Mindcraft say's it's faster and scales better.
On top of that, after stating "opensource is a virus" Microsoft has egg on their face because they just cant for the life of them get hotmail to work without good old BSD holding the fort, and this is at a time when they're pimping their platform for .Net.
There are Free alternatives to all of Microsoft's products, and ones in developement for products Microsoft hasn't even released yet! Miguel's already pimpin' Mono to work with .Net.
Microsoft's days are numbered, they see the writing on the wall, they know they can't compete with a competitor that they can't buy, undersell, influence, or lock out of the market. The government stepping in right now, would just stop the inertia at a time when they're not needed anyway, they'd take the credit for the inevitable.

Monopoly or not aside, the governments role is to protect the consumer and ensure the consumer has choice. The government's role is NOT to leverage consumer choice for the benefit of Microsoft's competitors. If competitors are cutting each others throats giving away free software, and as the dust settles, the consumer has free software, and netscape's dead, the consumer has benefitted. What then, would the consumer benefit from the government flexing its arms at Microsoft on behalf of these businesses who lost the war to the benefit of the consumer? That's supposed to be how the Monopoly law works, to benefit, for, and ONLY, the consumer.

So where has the consumer lost? The consumer has both Netscape, AND IE, both free, and without the government stepping in where it would have hurt the consumer to do so.

The fact remains, Netscape is just as available as it's always been, if not more so. From the consumers point of view, the consumer has won. From Netscapes point of view, they are legally entitled to financial damages, but they are NOT entitled to having the customers choice overruled by the government on Netscapes behalf.

This isn't really anything more than a political issue I believe, I think this discussion is between the chairs on the left and the chairs on the right. :)

Source record: 34947

Thanks for the help, Thomas. There really is a hole in the case where the color tuning pot is, but the actual component can only be turned from above. I needed to open the case (but no need the move the heatsink - it has a hole as well) and the colors are now tuned - almost.

I tuned the colors following this simple rule: If I show color bars of all 15 different hues down the screen (using GTIA graphics 11), there should be a smooth "rainbow" with a natural transition between the colors (similar to what I've always seen with my NTSC machine, I guess). However, when I did reach this state, the standard Gr.0 blue looked more like turquoise. Am I doing this right?

>I think you are missing the point.

Not at all. The "point" was to try to make a "new" computer for $300.

MY point is that NO ONE WILL BUY ONE if it has half the features and
runs at one tenth the speed of a comparably priced system ALREADY on
the market.

> Rolls Royce still make cars to a standard
>not to a price. Kit cars (usually VW based) are still available.

And Rolls Royce has been in financial trouble for quite a while now.

And "kit cars" cost a ton of money, and hardly ever work right.

You can ride to the Space Station if you have enough millions.

But can you build an obsolete hackers' computer for only $300?

> I think a "kit
>computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Certainly, you can find something to fill almost any niche, if price
is no object.

I always lusted after a KIM-1, even though it cost more than our $300
price point, and did very little. Want to guess how many were
actually sold?

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

Well the users have always had a choice, simply to drop the
OEM version of Windows and pay extra for the retail version.
The vendors and dealers were just never any good at informing
the consumers.

Who are to blame, really?

Regards...

I think if you take a poll on new PC owners they would not know what an OS was you would be more likely to get the answer Word.
As far as experienced PC owners, what non-commercial OS are they going to ask for? I mean Really, Red-hat is not yet buying ad space in Time, newsweek, or insert-your-favorite-non-Linux-publication-here.

> Here's the real world situation. Microsoft can't touch Apache with IIS

They seem to be doing a pretty good job, and 'Code Red' virus seems to be proving it. But with several companies buying into the 'technology partner' status, and '.net' strategy, it seems to be Microsoft || die.

> On top of that, after stating "opensource is a virus" Microsoft has egg

Last time I checked(recently), hotmail was running windows 2000 on IIS. Yeah shocked me too. I was doublechecking it for accuracy and according to the website I used(I think it was netcraft) they were no longer FreeBSD. Which the NT-vs-Linux.org site needs to be updated cause that is the link I _was_ referencing in conversations.

Microsoft is not dead, possibly dying but I don't think so. They have very low overhead for the units they sell. Nobody is going to unseat them, I offer the following quote from an advert in the paper..."Please send your

resume in word doc format." When your the standard the other guy has to be twice as good to unseat you.

See comment about Geos above. When I was consulting, 10 years ago, Geos was considered by some to be "better" than windows. For 3.10 that was not a huge challenge. But it's dead now and the company's only claim to fame is a (silly)patent on WAP. Is the consumer protected by geos' inexistance? Was Microsoft the first company to produce a software product called internet explorer? what happened to that company?
Was the lesson of geos, and the company who originally owned the copyright to the name to "internet explorer" as a program a benefit to the consumer?

> So where has the consumer lost? The consumer has both Netscape, AND IE,
> both free, and without the government stepping in where it would have

It wasn't that MSIE was free, it was that you couldn't get windows without it. It would be like firestone striking a deal with Ford that you couldn't get a shiny new (ford)SUV without firestone tires on it.

> This isn't really anything more than a political issue I believe, I
> think this discussion is between the chairs on the left and the chairs
> on the right. :)
>
I guess you must be sitting on the right, because I know I am on the left. oddly enough I am a Microsoft user, but only the OS. You see I bought the OS because it came preinstalled on my machine before I knew about your gaurantee. I don't have the office suite because I don't have the $450 to buy the non-upgrade copy. (oddly enough though the Corel office competing product is only $100, why is that?) I am writing this from a Linux box on a telnet session because the emulation is better.<rant /> Matt

: the market.

Bob, you are missing the point. The point is to play with an idea. The underlying question is: if we could create our own computer, how would be build it? The price point is there so that we don't build something, like a quad processor Pentium IV, or what be it.

It does not matter whether this machine will sell, because it is only an idea. Sometimes ideas are good, and sometimes ideas are bad. There is no sole judge of quality and, if there were, it certainly wouldn't be on marketability. In this day in age, the Apple II, Amstrad, Amiga, and Atari have very limited markets. That does not mean that these machines were bad ideas. It certainly does not mean that we who use them have bad ideas.

And even if sales were an issue, I'm sick and tired of this damn "you must own the market to be successful" mentality. To pick on Commodore and Atari: these companies were split up, sold off, and bought by other firms. Does that mean that the Amiga or Atari ST were unsuccessful. Apple's marketshare is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that Apple is a failure? Apple is almost 25 years old. Is Sun a failure, by the same logic? Of course not. It is absurd. If I can make a living while serving a few hundred clients, I would consider myself a success. If I could do that with my 68k proposal. And, as I pointed out, similar machines which are targeted to a limited market already exist in the sub-$300 price range.

Yes, 68k and Z80 based computers are still made. A tenth of the power? Heck, I'll bet that the 68000 is a lot slower than that. Ditto for the Z80 based machines.

The point is: these machines are not targeted at the same market that Windows, or MacOS, or any other entertainment/office platform is targeted at. The TI-89 is designed as a calculator, and the design is directed towards portability and the entry of mathematical expressions. But don't be fooled, this is a computer as powerful as an Atari ST. It is routinely programmed to serve other purposes (assembly, C cross compilers, etc.).

Does TI sell millions of '89s every year? That is doubtful. They offer about a half a dozen different models (again, some are Z80 based and are just as programmable). HP is probably their biggest competitor, in a similarly small market -- and there are others. Are any of these companies

or product lines a failure as a result.

If you want to by your dime-a-million VCR's and Wintel computers, be my guest. If you think that our discussions are illconceived, so be it. But if you are more interested in tearing our designs apart than contributing construtively, I suggest you shut your mouth, add this thread to your kill file, and forget this little band of crazies exist.

Good night, and thanks for puting me in a foul mood,
Byron.

Actually, I don't think Microsoft had anything to do with it, Commodore
couldn't market pardons in prison. They had a bad habit of marketing to
customers they already had, or "preaching to the choir."

> > Do you really think that everyone with windows on their computer

;)

Most of our customers ask for Windows 2000, thinking it's 98's next
version. Then they ask about the Millenium version, so we tell them that
it's WinME they're thinking of. The ones who don't ask about the OS just
assume that Windows "comes with" their computer, they also assume
MSOffice comes with it also.
Then we hit them with the price. Win98/ME $99 installed, Linux, your
choice of distro, $50 installed.
Some ask, "what do you mean installed?", We respond, "that means we
install it" (as if the HDD was manufactured with an OS on it, sheesh).
"But Gateway doesn't charge for that!", "Yes they do, it's built into
the price they're charging you for the OS, we're not charging you extra,
we're giving you the option of not paying for something you may not
want"

> As far as experienced PC owners, what non-commercial OS are they going to
> ask for? I mean Really, Red-hat is not yet buying ad space in Time,
> newsweek, or insert-your-favorite-non-Linux-publication-here.

Red Hat /is/ a commercial OS, and an "expierenced PC owner" has I'm sure
been flooded with information and hype et al about linux, including from
such sources as... Time, Newsweek, insert just about any major PC
magazine here. In fact, didn't Time do a huge article about Linus and
name him one of the "people to watch" right under (or was it above) Bill

Gates?

;) I don't know if we can look at virus proliferation as a sign of
Microsoft dominance, but it's a funny thought. ;)
I remember several people talking about the P3-unique ID the way some
talk about .net. We'll see how many die from lack of .net.

If you used Netcraft to check their servers, you were seeing a straw
man. You'll notice a few weeks ago netcraft identifies them sometimes as
"BSD" sometimes as "2000" and I even saw a "???" listed, MS is playing
games putting an "airgap firewall" up. (which by the way, is actually
good security practice, my firewall is linux, but it reports itself as
NT4 :) It's harder to hack if you don't know what you're hacking)
But Microsoft has recently stated that they were using BSD, and that
the transition would be gradual so as not to effect the user. This has
been going on for a while now.

You don't have to unseat Microsoft, and they don't have to die, they
will simply become less relevant over time, Like the term "Word Doc" is
less relevant now, since like Kleenex, many Word Processors can save to
Word Document format. Sometimes common usage is a bad thing for the
trademark holder, it can be a sign of evaporating relevance.

Geos still exists. They simply renamed themselves "New Deal Office" and
are marketed at Doorstop-technology machines, like old 486's. They
wern't squeezed out of the market, they chose a niche, that they are
currently filling.

> Was Microsoft the first company to produce a software product called
> internet explorer? what happened to that company?

They sold their rights.

> Was the lesson of geos, and the company who originally owned the
> copyright to the name to "internet explorer" as a program a benefit to the
> consumer?

Considering the consumer gets it free? How is that not a benefit? The
consumer also gets the competitors product free also. I can't think of a
way that the consumer has lost, can you? And guess what? there's more!
If you have a hankering for something different, there's Arachne for DOS
(free) and Opera for Windows, get this, selling their browser, in spite
of Netscape and IE being free. You know why, they built a browser that
suits the needs of some people who are willing to buy it where as the
free ones didn't. (actually tried Opera, didn't like the MDI-windowed
interface, but it was fast!)

I hate to break it to the Netscape people, but netscape was a pain in
the ass quite often, up untill V6 anyway, 6 looks good. (Why couldn't
Mozilla use 6's interface instead of that legacy 4.7 crap?)

> > So where has the consumer lost? The consumer has both Netscape, AND IE,
> > both free, and without the government stepping in where it would have

> Without AOL would netscape 6 even exist?

Probably not, or at least it wouldn't be as good as it is now. The same, however, can be said for IE. Would IE exist, as it does now, if not for Microsoft?

> > The fact remains, Netscape is just as available as it's always been, if

But if they decided to give you the tires for free, to keep, and you had the choice to take that money and buy your own tires, in addition to keeping the firestones, well,hey!

Demand.

You should have bought the PC from someone who could have sold you an OEM MSOffice. (well, assuming you bought them at the same time anyway)

Here's a tidbit, we make more selling Correl Office Suite than we do MS Office. Last time I ordered Corel (OEM version mind you, but the whole Office Suite) it was $14 my cost, we sell it for $95 installed, with correl Office ServicePack3 patched and all. Should be a National Average price, since I had to get it from Ingram Micro.

> I am writing this from a Linux box on
> a telnet session because the emulation is better.<rant /> Matt

Writing this from Microplanet Gravity on WinXP RC12505 (gettin RC2 tommorrow!) Microsoft's newsreaders suck. It's worth the price for

Gravity. (I just didn't care for Agent, it felt like a 16bit app, just me?)

And where, pray tell, would you get, for example, a Dell Precision
(complete with cool case, quirky motherboard arrangement and proprietary
power supply) preloaded with QNX?

Or did you mean "I can find something a bit like it somewhere else"?

AndyC

> what I've always seen with my NTSC machine, I guess). However, when I did
> reach this state, the standard Gr.0 blue looked more like turquoise. Am I
> doing this right?

I'd say so. The default colors for Gr.0 is here a kind of "greenish blue",
almost turquoise. PAL and NTSC colors seem to differ a bit anyhow. For example,
I've been told that NTSC displays hues 1 and 15 in a different way, even
though they look the same on my PAL screen. Hue 10 is sometimes said to be
"blue" on NTSC, but it is definitely "green" on PAL. (Gr.0 background uses
hue #9, Star Raider uses hue #10 and the manual calls it "blue", but it comes
out green here.)

So long,
Thomas

I think the biggest reason for this is that most of the people (not the technogeeks like most of us here in these newsgroups) simply don't know about the alternatives. Your average computer user will most likely get their new overpriced system at one of the big retail chains such as Circuit City, or Fred Meyer, or whatever. When they walk into one of those places and look over the selections, they will see the stats on the display models, and it will most likely list some form of Windows, some form of MS-Office, and probably a trial subscription to MSN or AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).

As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.

So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

>Bob, you are missing the point.

Actually that's not entirely true.

This thread has split into several directions from the original question of what a $300 "home computer" would look like.

Some of the threads I've stayed out of, since I really don't have any experience with the esoteric CPUs that have been proposed (other than knowing that they ARE esoteric).

Other threads have pointed out that successful, well appointed $300 computers already do exist, with no necessity of leaving out CD-ROM drives or I/O ports as the original post suggested. Those I've participated in, my response was one of the first ones actually, with the comment that I just bought a very nice, new PC for less than the suggested $300 price point, with nothing left out to cut corners.

More threads have questioned what the potential market for the proposed new system would be. This is where my questions about the marketability of a system like this have fallen. Unless the proposed audience is only the handful of people participating in this discussion, then the question of the market for any product has to be addressed.

(Yes, I know this is all hypothetical, but it's still a valid question)

> The point is to play with an idea. The
>underlying question is: if we could create our own computer, how would be
>build it? The price point is there so that we don't build something, like
>a quad processor Pentium IV, or what be it.
>

Oh, I'm very familiar with the idea of kicking around concepts- the question comes up on a regular basis in the Atari newsgroups. It's

usually phrased something like "What CPU would you like to see in a new Atari ST clone?" And it goes back and forth, much like a lot of this discussion has, with no one really ever believing it really could happen, but it's just fun to talk about.

>It does not matter whether this machine will sell, because it is only an
>idea. Sometimes ideas are good, and sometimes ideas are bad. There is no
>sole judge of quality and, if there were, it certainly wouldn't be on
>marketability.

Well, the original post presented the idea with a definite slant toward the marketability question.

Why propose leaving out such features as a CD-ROM drive to cut corners down to the $300 point if marketability wasn't an issue?

The original question was presented as if a new "hackers" computer might be a viable product, if only the cost could be contained to a reasonable level, similar to the "good old" machines we used to tinker with.

>In this day in age, the Apple II, Amstrad, Amiga, and Atari
>have very limited markets.

I would say they have ZERO market, but there are those among us who might get upset at that.

People still buy wax cylinders for Edison phonographs but that doesn't mean there's a viable market for them.

>That does not mean that these machines were bad
>ideas. It certainly does not mean that we who use them have bad ideas.
>

Definitely not. The current situation (for anything) doesn't change the history attached to anything.

The Apple computer was groundbreaking. It brought commercial success to the brand new microcomputer world truly for the first time. All the earlier attempts were close, but no cigar.

Atari was the most technologically advanced computer of its time. It's coprocessor chip set was far and away better than anything available when it came out. The fact that Atari, Inc, and Atari Corp couldn't figure out what to do with it doesn't take anything away from the computer itself.

The Commodore 64 was THE most successful microcomputer of ITS day. It was the best selling computer in the entire world, at that time.

The TRS-80 was a solid, well marketed system. It was headed in the right direction with its business applications. You could buy one in a million Radio Shacks.

All of these were good ideas, at the time.

You'd have to be crazy to try to sell any one of them now.

>And even if sales were an issue, I'm sick and tired of this damn "you must
>own the market to be successful" mentality.

"Owning the market" is an unusual situation. Generally there are
several competitors, each with its own market share.

The auto industry has many players, but they all provide a
"standardized platform". When you buy a car, you get the same four
wheels, the same steering configuration, much the same control
mechanism. There are variations, of course, but the basic product is
built around a standardized platform.

The computer industry has standardized on a platform as well.

> To pick on Commodore and Atari:
>these companies were split up, sold off, and bought by other firms. Does
>that mean that the Amiga or Atari ST were unsuccessful.

Those are not the reasons why the Amiga and ST were unsuccessful, they
are the result of the products being unsuccessful. The companies
might have survived if the products had been successful and had sold
well.

> Apple's marketshare
>is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that
>Apple is a failure? Apple is almost 25 years old.

That makes Apple far more of a success than any of the other companies
mentioned. Those other companies are all dead.

Simply by surviving for 25 years, Apple has succeeded.

Apple does that by selling products people want to buy. They've had
failures, sure, but they generally learn from them and bring out other
products that are more successful.

> Is Sun a failure, by the
>same logic? Of course not.

Sun has a very good position in its chosen marketplace. It too sells
products people want to buy for their specialized needs. In that
respect, Sun is very successful in its market.

> It is absurd. If I can make a living while

>just as programmable). HP is probably their biggest competitor, in a
>similarly small market -- and there are others. Are any of these companies
>or product lines a failure as a result.

The definition of success or failure depends on many things.
Obviously both TI and HP consider some of their products to be
successful since they continue to sell them and to introduce more
models. Other products are dropped from the product mix.

One thing you can be sure of though, if no one bought a TI calculator
model, it wouldn't last long in the marketplace.

It wouldn't matter what features it had, or what CPU it was running,
or how loyal the people who might have bought one felt about it. If
it didn't sell, it would be dropped.

And they certainly wouldn't introduce a new model unless they felt it
WOULD sell, and they had researched the marketplace to be sure.

My questions about the intended market for the "$300 Hackers'
Computer" are along the same lines.
>
>If you want to by your dime-a-million VCR's and Wintel computers, be my
>guest. If you think that our discussions are illconceived, so be it. But
>if you are more interested in tearing our designs apart than contributing
>construtively, I suggest you shut your mouth, add this thread to your kill
>file, and forget this little band of crazies exist.

Like I said, discussions like this can be interesting and can expose a
lot of people to concepts they might not have thought of otherwise.

But part of discussing what might make a successful new computer has
to be a discussion of what made earlier attempts fail.

As much as I loved my Atari 800, I know why it disappeared from the
stores, and why my Commodore 64 fell from being the most successful
computer in the world to a $5 thrift store white elephant. And, I
know why the other computers I have now have succeeded.

>
>Good night, and thanks for puting me in a foul mood,
>Byron.

Sorry about that- unfortunately that's sometimes part of being
"devil's advocate".

> actually sold?

Getting even farther from the original topic. It is quite easy to have
a "kit" computer for next to nothing. Here's my current little kit
project...

http://www.oz.net/~otter/gallery/Thissle.JPG

This is eventually going to be a dual-boot Linux/Winblows-98 beast.
Here is what Thissle currently has:

ISA/PCI motherboard
Intel Pentium-120 CPU (Socket-7)
40 MB RAM (72 pin SIMMs - 4 8MB SIMMS and 2 4MB SIMMs)
256K Cache
Hard Drives:
IDE x4 Quantum Fireball ST3.2 3.2GB
Western Digital AC-2850H 850MB
Maxtor 71260AT 1.2GB
Fujitsu M1636TAU 1.2GB

SCSI Quantum ProDrive LP240S 245MB

CD-ROM Chinon CDS-53S
Colorado-250 Tape Backup Unit
Standard 3.5" HD Floppy Drive
Trident TGUI-9680 PCI Video Card - 2MB
56K Modem - ISA

AMD AM-2100 NIC Card - ISA
Adaptec AHA-152- SCSI Card - ISA
SB-16 PnP - ISA
Nice SVGA PnP monitor
Typical 2 Serial Ports and 1 Parallel Port
She still has 2 empty PCI Slots

Right now, I'm just messing around with her Win-98 side, mostly for hardware testing, and for teaching myself networking. The Network hub sitting next to her will be used to link her and SunBlossom (the P-166 system I'm posting this from) together, as soon as I find the documentation for the hub.

All total, I think I have at the most $25 to $30 invested in her. The majority of her components were given to me from friends and co-workers who know I like this old stuff, with the rest being purchased from thrift stores.

I think this definitely qualifies as a "kit" computer, or at least as a "geek station". :) She's got enough to be operational, with plenty of room for upgrades and expansion as super cheap components become available.

Now as for the original question that started this whole thread...I'll have to think on that. Should make good bathtime thinking material later today; or goo drifting off to sleep thinking fodder. On that note, it's time for me to get some sleep.

Night all.

Maybe I should have left more context in, because I'm trying to figure
out your implication.

My recollection was that the KIM-1 was a popular computer, though
at a time when popular didn't have to mean a large quantity. At
the time it was sold, it was still early in the cycle of small computers.
People were still wanting computers because they had always wanted
a computer (something a few years before was an impossibility for
most), rather than because they had a need to do something with
a computer. So the low cost, for the time, was to many more significant
than the fact that it lacked memory, etc. In fact, the KIM-1
wasn't all that limited for the time, remember the Altair came
with something liek 256 bytes of memory. To get a computer
"that did something" you'd have to spend considerably more.

And of course, some people took their KIM-1's and made them into
full-blown systems, with video boards or dumb terminals, 32K of
memory, disk drives, and all kinds of things.

I have a KIM-1, got it in 1979 (late for the time, but clearly
way before most people got computers), so I'm biased. But my
impression is that the KIM-1 was an influential system,
coming between the S-100 systems that started it all, and
the all in ones that came in 1977, like the Apple and the Radio
Shack.

And now I'm really curious about your impression of how many
KIM-1's were sold.

Michael

4851. Atari 800XL with 1050 Diesk Drive. A few Questions.

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-31 16:18:26 UTC
From: Padraig@padraig.de
Message-ID: <b519c84f.0107310818.14ddf20d@posting.google.com>
Source record: 34968

Hi.

I bought an Atari 800 XL about 10 years ago but because of the lack of software or other stuff never used it much.

Recently I bought a 1050 Disk drive in Ebay with about 250 Disks. I've looked at 115 of these disks now and there's a lot of stuff on them.

So now that the boasting is over, here's my problem. Most of the disks boot with a mini-DOS which presents me with a menu of programs on the disk. Most of these programs are Games. Whether a Rom-Cartridge image or otherwise i Don't know, but they are games. The game is loaded and started by pressing the menu option (A- M etc.)

However Some games do not work. Either the screen goes black and nothing appears or the screen goes blue and the cursor jumps to the top left of the screen. Booting with the "Option" key pressed sometimes helps but there are still some fifty programs that i havent gotten to work.

Any ideas out ther??

Another question I have concerns the Game M.U.L.E. This loads, I can go through the different selections players, Type of inhabitants on the planet etc then i get a message to standby while playing field is bieng prepared. And then I stand by, and ytand by, and..... How long does this normally take? Maybe I'm just impatiant.

Anyway, I'd be glad of any hints tips or tricks.

(By the way the 800XL is a european model if this makes a difference)

>too.

OK, I've got the file ready to go. I tried it out and it's not too bad. There
are a couple of traps that you can't get out of if you don't have the proper
item. Unfortunately I didn't kill the player off on a couple of these so you
are just sort of stuck. Also, the engine has a glitch. Once in a great while
when you drop an object, it remains in your inventory. You have to move to
another room for your inventory to reset.

There is a "SAVE GAME" command that lets you save your current position and
inventory, so use that occasionally in case you get caught in a trap.

Now, where do I upload this too? I've tried umich and a couple other sites,
but haven't found one that allows uploads. What's the best place to put new
uploads?

I think UMich and some of those other FTP-type sites are inactive
sites that (thankfully) just get left there. You might try sending it
to Closer to Home Internet BBS.

http://cth.dtdns.net/

James King, who posts here infrequently, used to offer an FTP site. It
might be better to get it to one of the archivist sites such as
Holme's.

Please send it my way! Use "daclmi AT intrex.net" not my return
address above. Thanks!

4855. Anyone Want to buy an Atari 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-31 20:29:50 UTC
From: Seryan <zyzzyy@yahoo.com>
Message-ID: <2zE97.57734$Gh1.8827924@typhoon.tampabay.rr.com>

I have a working Atari 800XL, in the original box.
If you are interested, make me an offer. I'll ship it
UPS.

Some of the games on the menus probably are 800 OS not XL, you need the
Translator to allow you to load them

Menu disks of ripped games.

Some games are proberly playing up either due to
a) the protection has not been cracked
b) the data has become damaged over time.
c) it may be (slim chance) an 800 game that won't run on xl/xe's
d) its looking for a peice of harware that could be inserted into the
cartridge slot to fool the machine into thinking its a cart image?

I picked up a simmilar load of disks at a shop up london. quiet a few games
caused the machine to re-start and or simply loaded in an obviously corupted
fashion.

Should normaly load after the selection and pressing the key to start. Does the menu show Mule and Data? and does it show how many sectors.

maybe its missing a bit because its a multi load.

Cool! Now we have an iPAQ Linux and WinCE version. Now if we can just
connect up real 1050 disk drives to the serial port and read some real
disks, that would be even cooler!

hmmm... In my machine, in NTSC, #1 and #15 look almost the same. #9 is surely
blue, and #11 a turquoise (or maybe cyan), #10 is either a blueish green or
a greenish blue... depends on the TV tuning, I guess.
Some time ago I made a TV calibration program, maybe you can try to use it...
You shouldd be able to find it at

http://www.geocities.com/Hollywood/2645/A8/

Take every file with the letters "tv" on it.

Some of those .exe's may need a translator to deal with differences between the 800 OS and the XL

Sometimes pressing ESC or RESET after the loading stops may trigger the code to reinitialize and start

There may be some damage on some of the disks; are all of the sectors readable and full of data? Those boot loaders usually do not report errors..

MULE should be quicker.. I don't know the fix, but what you describe is not a normal load..

Booting with OPTION to remove Basic and enable more RAM is the norm, very few will need or tolerate Basic's presence.

Agreed.

>And "kit cars" cost a ton of money, and hardly ever work right.

This is true only if you are not mechanic enough to assemble it
correctly. For example, A hopped up Myers Manx could beat $25,000 or
$30,000 Italian sports cars on the race track back in it's day. In 1968
a $30,000 car was _supposed_ to be a lot of car. (But seldom really
was.)

And, a kit computer is worthless only if you lack the ability to
assemble it.

>You can ride to the Space Station if you have enough millions.

I hope my new program for picking lottery numbers works!

>But can you build an obsolete hackers' computer for only $300?

You can buy an obsolete hacker's computer Goodwill or some other thrift
store for a lot less than that.

BTW, I am posting this from a Windows box, but still enjoy just fooling
around with an old 8-bit computer almost every day.

Best regards,

Sam Gillett aka Mars Probe @ Starship Intrepid (972) 221-4088
Commodore lives . . . . . if you call 1200 baud alive!

Just who is this $300 computer being buildt for?
some geek who likes 3" thick manuals about command lines
or who wants to play with electronics?
or is it for the people who can not afford the fancy computers
if its for the last you have to make the OS simple along the lines of Mac
or Geos or you will not sale many if its hard to use. and your stockholders
with not be happy.

I mean verbatim what I said. Name your specs and I'll find you a PC.
you want QNX? NetBSD, FreeBSD, OpenBSD, NT, Windows (MS), Solaris,
SCO Unix or Unixware?

If the OS is available, it's available on a new PC.

<disclaimer> (and this isn't a cop-out)
This does not include asking for hardware and OS combinations where the
OS doesn't support the hardware you asked for, then claiming I lose
because said hardware won't work, ie: asking for AmigaOS for the Vic-20.
</disclaimer>

<good faith>
I won't just say it's available, I will point you to where you really
can purchase the machine, and actually get a quote for the machine, with
your OS of choice installed, at a very competative price. If you need me
to show you the actual quote to prove it, then so be it.
</good faith>

4871. Alternate to $300 68000 - Atari on a card.

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-01 09:41:07 UTC
From: Eric <white_knight_411@yahoo.com>
Message-ID: <tmi6ua6d7t986f@corp.supernews.com>

This is a first post for me around here, so please be kind.

After watching the threads about this intreaguing idea, I had a thought.
Would it be posible to interface a one-board Gem computer to the pci bus
kind of like the dos cards for sparc, or cpm cards for the Trashes?

Using existing hardware on the pc or mac would save dramatically and
would leave development a wide open path. Just look how long ISA lasted.

We could then even try(in the far flung future) parrallel processing with
"powerful" 68040 based boards. Enough of 'em would really pack a walloup
running a TOS based system.

---Commentary based on my VCS on an ISA card Idea that never came to be

Regards,
Eric

Not much good at all, I agree.

This is why Microsoft has been so successful, people don't know any better, some people. It has very little to do with availability, or any other notion that "you can't get it" (the competitors product.)

That however, would be ridiculous to try to pin on Microsoft. (although in our courts, anything's possible ;) I can see the headlines now: "Microsoft charged with having customers who don't know any better, Microsoft denies charges, plans to appeal."

The truth is, the customer has choice. If he can't make an informed choice, then maybe we should make more effort to inform people of the choice they do have.

4873. Help, Broken keyboard cable

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-01 09:48:02 UTC
From: Eric <white_knight_411@yahoo.com>
Message-ID: <tmi7bcb7coh9f0@corp.supernews.com>
Source record: 34907

My newly aquired 800XL just got upgraded to a 60 meg IDE with 1 meg ram
using plans from the net, but during reassembly, two or three of the leads
on the
keyboard connector came loose on the computer end, so now I cannot
reinsert the cable.

Anyone have any suggestions as to how I can fix the cable?
Should I try soldering wires to the cable and connector?
Buy a new 25 cent xl and be more careful?
I don't want to recase and use a mod. pc keyboard.

Regards, and thanks in advance
Eric

You could get "98lite" which is a piece of software that lets you do a number of things...

1) Install 98 without IE.
2) uninstall IE from a preinstalled 98
3) install 98, and IE, without integrating them.
4) deintegrating IE from a preinstalled 98

You don't need to use this product though, as you can do it yourself if you feel comfortable juggling system files. I might try to dig up the instructions for the DIY method, if I get a chance.

What on earth gave you the idea routing was hard in Linux? IME, it's
a damned sight easier than in anything from MS. It's even easier in
OpenBSD and Solaris.

> wierd protocols like PPPoE)

I see no point in PPPoE. Why would I ever want to use it? I'm not
even sure what uses it other than some broken cable modems used by
inferior providers of no service worthy of my consideration.

I guess I'm a total novice about DSL. I have cable, and my Linksys Router/Switch came with directions about setting up PPPoE, but seemed to imply that it's necessary for DSL. I certainly don't need it with cable.

Maybe that sheds some light on this sub-sub-sub-topic?

Vintage Computer Festival 5.0
September 15th and 16th, 2001
Parkside Hall - San Jose Convention Center
San Jose, California
http://www.vintage.org/2001/main/

Mark your calendar! The fifth annual Vintage Computer Festival is scheduled for the weekend of September 15th and 16th at Parkside Hall in San Jose, California.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

EXHIBIT YOUR VINTAGE COMPUTER

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. First, Second and Third place prizes will be awarded in 13 categories, including the coveted Best of Show.

For complete details on the VCF 5.0 Exhibition, visit:

http://www.vintage.org/2001/main/exhibit.php

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. If you would like to rent a booth or inquire about consignment rates, please send e-mail to <vendor@vintage.org> for more information or visit:

http://www.vintage.org/2001/main/vendor.php

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the VCF 5.0! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

Actually in my area, it's DSL that uses PPPoE...Qwest does it with
some internal DSL modems from Intel so they can turn off the
connection when the person isn't surfing the 'net.

Of course, you can get the DSL without having to use that, but it's
an extra $10 a month plus you have to pay for the modem...they give
you the Intel internal modem for free...

Flipping every vblank is quite common. I have the glasses I bought from
Federated. And a circuit that took a complicated route to the A8, which I
made changes too. All ready to put together, just haven't had the time.

..."are things usually done by someone who should probably spend a
little time learning anyway."

PPPoE is used mostly by DSL providers.

It's a pain in the butt to do in linux, when you have multiple distinct
PPPoE clients that must be routed securely, not just "NATting" them
together behind one PPPoE interface to the DSL.

As far as there being no point in it, if you get stuck having to do it,
you have to do it. (and it sucks)

What utter rubbish. Realspec on my old intel emulates a Sinclair Spectrum
very nicely indeed.

There was an attempt to do simmilar with the amiga by escom, taking the core amiga chipset and fitting it on a board for plugging into PCs. Like escom, it came to nothing.

So the plausability is there. These days though wouldn't a 680060 be a beter chip to go for?

Just a thought.

I guess I don't fully visualize the situation... The XL mainboard has a 23 connector thin edge card type receptor for the mylar from the keyboard assembly. Did some of the painted traces separate from the mylar?

If so, and you cannot trim the mylar and still reach the connector, then Best or Lance at Video61 or cannibalize the mylar or keyboard from another XL may be the choices.

Experience is something you don't get until just after you need it.

4896. Searching: Atari Converters...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-02 17:00:33 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B698731.876F9CCE@mail.uni-mainz.de>
Source record: 34916

Hello folks,
I am in search of the following ATARI-8 converters, if avaiable:
1) a GIF to HIP (greyscale gr. 9+9 intl.) converter
2) a GIF to RIP (color gr. 9+10 intl.) converter
3) a JPG to RIP converter
4) any TIF(F) converter (maybe gr. 8,9, 15 at least, with
save-routine!!)
5) any BMP converter (also gr. 8,9,15; with save-routine)
6) a Degas converter (one that has a micropainter save-routine; the one
from Jeff Potter supports gr. 8, 9, 15 but does not have a save-routine,
arrggghh!)
7) a Midiplayer (*.MID) that plays those Midis via pokey chip
8) a MID to CMC converter
9) a MID to AMS converter
10) a MID to Softsynth converter
11) a MOD/MD8 to Softsynth converter
12) a softsynth to MOD/MD8 converter

As far as I have read, some of these programs should be already
avaiable. anyone knows where (XLSEARCH does not find any of them!) ???
Or maybe this is a nice chance for programmers to write something new
for the little Atari... -Andreas.

4897. My-DOS Utilities...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-02 17:21:24 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B698C14.1FFA85D7@mail.uni-mainz.de>
Source record: 34917

Hello folks,
again I am in search of the following tools for My-DOS:
a) some Undelete + Recover program
(undelete any deleted file/any density; recover any deleted
Dir.+VTOC, deleted
via Quickformat, Fastformat or Clear directory); should support
subdirs!
b) a file sorter program (any files, any density; sort by name, extender
or
size); should support subdirs!
c) a "delete Directory" (deltree) program, that deletes any directory,
no matter if it includes files or other subdirs; any density of course!
d) a "rename" directory program, that renames any directory or
subdirectory, no matter where it is or what it contains; any density;
e) a Gamedos that supports any MyDOS density plus Subdirs; especially
one that supports up to 65535 sectors but with 128 bytes per sector...
f) a MyDOS filecounter; that counts all files in any dir/subdir and of
course in any density (sometimes you want to know how many files you
have on a whole partition or in a certain directory/subdir.)
g) a "tree" lister that lists the whole directory/subdirectory tree(s)
on a drive or partition...
h) a highspeed or ultraspeed routine for various floppy speeders, that
works correct under MyDOS and at least Single, Medium and Double density
(most of all, a highspeed/ultraspeed routine that works with MyDOS and
turboBasic XL!!)
i) a new disk formatting utility, that only lists these 6 formats:
1) Single (90kbytes) 4) DSDD 40T. (360kbytes)
2) Medium (130kbytes) 5) DSDD 80T. (720kbytes)
3) Double (180kbytes) 6) High Density (1440kbytes)
so there would be no need to use MyDOS options O, P and I together...
j) a harddisk formatting utility, that only lists the following:
- sectors (x-65535)
- drive (1-8) since D9: is always Ramdisk!
and as soon as you press return then,the HD is formatted in MyDOS
format.
k) a "move" file utility, that moves a file to another dir/subdir (and
then deletes the source file); should work with any density...
l) a "move" dir/subdir utility that moves a dir/subdir to another
dir/subdir without the need of copying (just rewrite the links and
such)...; should work with any density...

Maybe these MyDOS tools already exist (at least they all exist for
Sparta-DOS!!), if not I do hope someone is willing to program some of
them soon... -Andreas.

From: Video61@webtv.net
Message-ID: <5961-3B69AA1E-7@storefull-173.iap.bryant.webtv.net>
Source record: 34923

i am pleased to announce that the team at video 61 has almost finished
the speedo rpm disk drive checker cartridge. it is in its final stages
of testing, and we are about to design a label, and documentation for
it. then it should be ready for sale.
it is a 100% machine language program, i have tested it on a stock xf
551, 1050, and a 810. i have yet to test it on a happy, but i have
tested it on a u.s. doubler 1050, and i am quite satisfied with the
results.
this is a nice utility cartridge that can help in diagnostic problems
with a drive that dose not boot some programs, or as a toy to play
with:)
thanks,
lance

You've never played Atari ST games on a PC using an emulator then, I
take it? Or Atari 8-bit computer software on a PC?

Hey Dunny

Don't waste our time. You have not proof. I've been programming and working in electronics for years not only as a hobby but also in my career. I am quite familiar with the intel, 6502 and other processors. You simply cannot effieciently emulate one cisc process on another. Its physically impossible.

Bob,

I've made the rounds of nearly all the emulators. No fallacious arguments to say software emulation is easy or stable can hold up to scrutiny. take a close look at what you need to emulate a stock 8mhz ST on any PC, it isnt the least bit realistic on anything less than a Pemtium2-200 and certainly isn't stable. Risc processors have a better time with emulation but don't even try to waste more of my time saying any intel processor can do a good job of it. It simply isn't bact up by any fact, and likely never will be.

Seems that Scott Cohen has gone through Xlibris to re-publish "Zap!".
See the following link:

http://www1.xlibris.com/bookstore/bookdisplay.asp?bookid=12003

It seems to be abailable from all the popular on-line bookstores. Has
anyone gotten a copy?

Whatever happened to CGE's attempt to republish the book? Did it ever
happen? Here's their July 1999 press release:

"CGE '99 will also see the re-release of the book, ZAP! The Rise and
Fall of Atari. CGE Services Corp. has inked a 5-year exclusive deal with
McGraw-Hill for rights to re-print Zap."

I wish I could find my old hardcopy edition, but this will do for now...

Oscar,

This is the CGE re-printed version. We weren't happy with what we were offering which was a bound printout of the .pdf file so we decided to use the Xlibris service to get the book back into the stores. We fixed some of the spelling errors and did a nice new cover for it.

Please note that this has nothing to do with Scott Cohen. The rights are owned by McGraw-Hill and licensed to us in an exclusive 5-year deal.

If anyone has picked up the new version, please let us know what you think.

Thanks,
John

Utter nonsense.

The architecture of the Z80 (used in the Spectrum Dunny referred to) and
x86 have a common ancestor (the 8080) which means you can produce some
very effecient emulation because many things, like flags etc, are very
similar.

So how is it that by sitting in front of a pentium 150 I can run JPP or Realspec (slowly) and play a nice game of cybernoid? Hmm? You sir, are talking out of your bottom.

For more proof, visit www.worldofspectrum.org and see what a KNOW LIAR you are.

There's a great (free) PC app at: http://www.xnview.com

I've also got a couple of 'C' programs that I wrote
for the ST that converted a degas PI1 file to an A8
file (or byte data for inclusion in an assembler).
Basically you use a good paint program (e.g. PSP)
to reduce the palette to 4 colours and the picture
to half of a 320*200 image. Then the apps (run through
an ST emulator) can rip the screen as a screen or by
squares, i.e. for sprites.

Let me know if you want more details.

On a similar topic, I remember a STOS app (I think,
or it may have been crackart) that lets you look
for sprites within files by letting you scroll
through the data and letting you alter the display
width. Does anyone know of a a similar app for the
PC that might also let you alter the bit depth?

Thanks,

Mark

He should have written "Todos los juegos y emuladores del Atari 800XL"...
Your computer made a good translation, but as I see it, the phrase
would have been meant to be interpreted like "All the Atari 800XL games
and emulators"...

I remember the chileans used to have more interesting things for the A8 than
what we got here... Let's see what's there. Maybe even Gunship?

4931. ebay question about item i bought.

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-03 19:41:55 UTC
From: bo snyder <bobo_snyder@hotmail.com>
Message-ID: <B7904C92.F135%bobo_snyder@hotmail.com>
Source record: 34853

hi everyone.

this may sound like a really stupid question but i need a little bit of help.

basically i bid on something a little over a month ago.

i emailed the seller the day after i won the item. (it was an old atari computer)

he emailed me back.

i emailed him and said i would pay for it.

since that time (5 days after the action), my isp has gone to crap.

my old email acct no longer works. i pestered and pestered my isp for the last month, and basically they told me that they did away with the old domain (such as my email addy) email addresses and that there is nothing that they could do about the old emails. i don't have those emails since i accessed them with webmail (such as mail2web.com or equivilent).

anyway i am trying to contact the seller to let him know that i still want to try to pay for the item but i can't access my email and while at ebay i searched for "by bidder" and included completed items, however that only goes back 30 days.

how the heck do i contact this customer to let him know that i still want to buy this item before he gives me bad feedback???

thanks
bo

You're talkin to an Ebay expert here, just ask all the others I've outbid here.8-) Chances are the sale has been ditched and relisted by now. One way you could do this, is to go to your feedback page- where you leave feedback to others all at once and it should show all of the unfeedbacked sales with ID names. If no luck, I have an atari 800 xl w/box, 1010 recorder w/box, 1027 printer, volksmodem 300baud. Make me an offer!

4940. Atari Microsoft Basic

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-04 11:45:16 UTC
From: Mo <mygranny@'nospam'swbell.net>
Message-ID: <unPa7.593$TM5.169253@nnrp2.sbc.net>
Source record: 34862

I got a hold of an UNOPENED Atari microsoft Basic package for the 400/800's. It's still shrinkwrapped with a pricetag of $79.99 on the front. Package says it includes diskette and manual, but feels pretty heavy. I'm not trying to brag, I just can't decide if I should open it- or leave it sealed. If I open it. I'll make an ATR and maybe a quick reference to post up on my webpage. If I do that do you think Bill Gates will sue me? I don't want to be pirating 'intellectual property' or anything. Not that I'd be hurting the sales of this product or anything...

Mathy.
I've been out of town, so this response is late.
Yes, it is George Morrison from Alpha Systems.
He lives here in Ohio and wants to get his stuff over to PC.
Seems like a nice enough guy. He might share some of his
stuff, but I didn't get into that with him. I just showed him how
APE and cable work. He has 100s of disks and 1000s of files.
It'll take weeks to get his stuff over to PC.

4947. Basic XL Toolkit Question

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-04 20:26:42 UTC
From: llpwhite@cs.com
Message-ID: <20010804162642.15271.00002359@ng-ft1.news.cs.com>
Source record: 34868

This is a question for someone with a Basic XL 1.03 (black cart; not orange) *and* the Basic XL toolkit that was supplied with the black cart. Does your toolkit manual say what version(s) the toolkit is supposed to work with? I have both versions 1.02 (orange cart) and 1.03 (black cart). My original toolkit works fine with 1.02, but not with 1.03. I'm guessing that the new toolkit was tweaked, and doesn't work with 1.02. :-(The original toolkit would only work with 1.02 -- not 1.01 or 1.0 (if 1.0 was ever sold).
Thanks,
Larry

The one that I saw back in '83-'84 was on a copy protected disk, so the .ATR
may not execute without a little tweaking.

I wouldn't put anything past Bill...

Yeah!

CMD makes great stuff for the C64, a device like this would be great for
running Atos or a BBS program. But for the everyday Atari user the standerd
130,320.512.576,1088k ramdisk seems to be enough.
It would be nice to have a 16 meg battery backup ramdisk :)

Source record: 34873

Version 2.0 of ATS has been uploaded to my web site at:

http://www.atarimax.com/

ATS is a free ATASCII terminal for any PC running Windows.

ATS will also play ATASCII movies, and can be throttled to play them at
as low as 300bps.

Improvements to 2.0 include:

Ability to attach to a serial port for modem use, instead of TCP/IP.
Ability to specify destination port for a TCP/IP connection.
TCP/IP Cleanup
File downloads over serial and tcp/ip connections now available.

Supported protocols:

X-Modem CRC
X-Modem 1k CRC
Y-Modem Batch
F-Modem Batch

File transfers can be performed in serial or TCP/IP mode, including raw
socket connections.

Thanks

Steve

4952. Re: Help, Broken keyboard cable

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-05 06:36:49 UTC
From: Eric <white_knight_411@yahoo.com>
Message-ID: <tmsdkd323qh4d6@corp.supernews.com>
Source record: 34890

I'm back and working again.
If you're interested, here's how I did it.
First. I dug out some spare parts from a Trash 80 I disected a few years
ago.
In the box was a mylar connector very simmilar to the atari one.
I cut off the atari connector's bad leads back three inches from the end,
spliced in a portion of the trash cable, and VERY CAREFULLY soldered
jumper wires across the gap. It now boots fine, and I'm now looking
for an upgraded os to run my software from (preferably with a built in
ramdrive.)

Thanks for all the suggestions and offers guys.

Eric

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

> Can you even recompile the base kernel with it?

Recent kernels can be compiled with their version of GCC. When RedHat 7.0 came out this problem did exist indeed, but it has been resolved by now.

Gcc 2.9.6 was the most stupid thing they have done in years anyway. But apart from that I find RedHat quite usable, although not perfect. But who is?

Well of course! The copy protection could almost be assumed knowing Microsoft. But also looking at the date of 1981 on the pack, the protection is probably extremely 'light'. Perhaps a couple of short sectors. If anything I could do a PRO image instead, which would also map out the protection on the disk. Mo

Ok. look in your crystal ball... how many people will get a linux PC when they
walk in Fred Meyer over a Windows PC?
They get the PC, then ask to look at the software section, or maybe ask if
they can run the same software they saw at their friend house.

I'm sure it better today and you dont have to spend a week getting a dev environment
to get basic tool to work. But its still a far cry from the software you get under windows.

Like you hint, the guy probably dont know linux.... can you imagine the guy walking back
asking for basic question as to why his new directx game wont install, or how does he
setup the new usb scanner he just got... or import his digital camera images, etc.. etc..
etc..

We are talking about 0.000001% . Thats why Dell droped the ball on linux. They dont offer
this as an option anymore. They realized that linux market is super specialized server and
hacker.
And hackers build their own PC's :)

BTW, I beleive its possible to have API like directx working on linux... So 'pure' directx
dev
could be ported in a snap to linux, but who we spend that level or R&D for those linux
user?

Stephan

I think they took it like "Remove your network stack, bad bad boy! you are a monopoly
you can integrate a network stack!" and from a totaly stupid request they just said "no
cant do"
because giving a valid answer wouldn't have made a diference.
In my view MS is really down at many people like they are technologie moron.

Anyway, lets look in 5 year as to what OS WONT have an integrated HTML 'parser' in the OS
as a base API service.
Should the US gov (and tax payer) bring to court QNX, Beos, etc.. ?

BTW, what happen when you type a ftp or http address in an explorer windows?
If you install Netscape can you 'fix' the now broken desktop and allow for those space to
be browsed again?
Who make 'namespace' http support for windows?

Anyway... time will again prove MS right and linux will follow.

Stephan

4964. Johny's Trouble

Hi everybody :

I am looking for years for a game called Johny's
Trouble from an polish software house named Mirage, if anybody has
this game in any format (.bin , xex, atr, etc ,etc) and can send-me to
this email please don't spam ctorres@netexplora.com
I apreciate a lot

Greets

I play from now and then, mainly with my cartridge games, but even when it's just sitting there, my Atari 800XL with its 1010 and 1050 looks gorgeous on top of the home theater.

> Why should they have to though? What extra power would my parents get (word
> processing, internet, dtp, spreadsheet) by using Linux over Windows or her
> Mac (actually my old Mac)?

None if they can use Office/Works already. I would give the Unix
Office applications a year to become functionally more useful than the
MSOffice equivalents. By more useful I don't mean that they will do
everything that the equivalent MS program would do, but it would do it
correctly. Office has so many bugs it is unbelievable. Still, large
software programs have bugs, so the Unix Office apps will get them as
well. I just hope that the emphasis for the Unix Office apps is going
to be stability and bug fixing over feature bloat.

The Windows interface is just as confusing to newbies as the Linux one
(say, KDE). Except that KDE comes with a whole pile of apps
preinstalled for free, KOffice, Konqueror, silly games, etc. Linux is
just a mess under the surface though, and the surface is dodgy. For a
home user desktop, it needs a single, consistent interface, easy to
configure printers, hardware, etc. MS is way ahead in these areas. QNX
is the best alternative desktop OS I have seen to date.

> What advantages would I have in using Linux over
> Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder,
> SQL Server etc?

VB - MS Technology
C++ Builder - Borland
VC++ - MS
JBuilder - Borland
SQLServer - MS

You would get none, of course. What advantages would I have in Windows
over Linux as a server programmer using Perl, PHP, Python,
PostgresQL/Oracle/MySQL?

> And there are not dozens of known security holes in most Unix/Linux

Hence you should use the more secure alternatives with length
parameters to prevent buffer overflows, such as strncpy.

And in particular, scanf(), gets(), sprintf(), strcpy() are not OS
functions but C runtime library functions, and the security holes
within these functions are present in *all* C runtime libraries,
including those running under MS-Windoze....

scanf() in particular is useless for anything but quick'n'dirty
throw-away test programs, and should never be used in a real
application.

: using your 8bit to do?

Sadly, not much at this point. I recently (about a year ago?) got some
additional hardware. A very heavy floppy drive, an 800, an 850, and tons
and tons of disks and some carts.

My 800XL is quietly sitting in a closet waiting to be hooked up as well.
I recently moved, and now have an entire room dedicated as an office/gaming
area (so my 2600, NES, SNES PSX, DreamCast, and two Jaguars are hooked up),
but am low on desk space, which is where I want my XL hooked up.

What I really need is a small desk somewhere to set up my router (once
I get friggin' DSL) and dump the scanner and printer on it (shared on the
network, of course :)), and that'll leave lots of room for my Commodore
monitor and XL.

Also, having all my odd serial peripherals (palm cradle, UPS data-line)
hooked up to the router frees them for an SIO2PC cable. :)

Speaking of that, is FEMUL any good these days? Or can SIO2PC or,
preferably, APE (the DOS flavor) run under DOSEMU on Linux?

Of course, what I'd REALLY like is my 1200XL, which Bob Woolley has been
tinkering with (much like Dr. Frankenstein, except the 1200XL wasn't dead :))
for, oh... YEARS? :)

-bill!

4975. DOSEMU and serial ports (for SIO2PC)

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-06 18:11:52 UTC
From: William Kendrick <nbs@bolt.sonic.net>
Message-ID: <I5Bb7.5270$P15.55552@typhoon.sonic.net>
Source record: 34749
Cross-posted to: comp.os.linux.misc,comp.sys.atari.8bit

There's an excellent program I used to use on a DOS machine a few years ago which let me use the PC as a virtual disk drive for my Atari computers (thanks to a simple serial cable doo-hickey).

The current Linux-based clone of the software isn't quite as usable as the DOS software was, so I'm thinking of using it under DOSEMU.

My question is: How robust is DOSEMU when it comes to serial ports?

(For the longest time, people were told not to even try using these DOS programs under Windows 3.1 or Win95, so they're really timing-sensitiy.)

Thanks!

-bill!

my atari 2600 was stolen....and i want to use an emu...
i still have a controller but i need to convert it to ibm game port....
please email me a circuit that does this...
ryouko@bellsouth.net
this is a friends aol account , bellsouth does not support news groups any
more...
but the email address at bellsouth is mine
i dont expect any one would care, but im only 14 and i would like to play those
atari games again
i had about 100 of them. even if i have to download them now to play them thats
fine as long as i get to use my cool slim lined left/right handed low profile
atari stick i still have :)
it was in another box cuz the first had no room left...
so i put this joystick and my TV cord and system power supplie in this box...
i dont know how they will play all those games with no power supplie :)
but i know im never gettign it back

Hello Nigel....

I belong to Paypal and have used it when I need to. It is a system
where you can get or give money to almost anyone. It is a very secure
way of doing business. if someone has something to sell me and is also
a Paypal member, the procedure is easy. I just logon to Paypal and give
the system the email address of the other person. Then I type in how
much money I want to give him and how I want to give it to him (credit
card/checking acct). Then the money is sent. This has worked well for me.

4982. Re: My-DOS Utilities...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-06 23:56:49 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20010806195649.17622.00003343@ng-cn1.aol.com>
Source record: 34756

That is a pretty big order... making them smart enough and versatile enough to suit your requirements involves too much coding; you quickly encounter the law of diminishing returns. Too much work to eliminate some minor inconvenience. How often do you actually need to undelete files and format hard drives? I use DiskTool or DiskMend for recovery; it is simpler to do it manually than code all of the possibilities into a suitable algorythm.

The beauty of a good gameDOS is getting it in 3 sectors so there are no conflicts in the VTOC, etc. when building the disk. This limits you to 384 bytes and puts density smartness and subdirectories very near, if not outside the realm of capability. Most I would attempt is a separate loader for 128 byte and 256 byte sectors.

I might consider working on the format utility. What do you know about the disk structure on the 720 & 1440K units? Does the Percom Data Block still operate at this level? What is the track sector count? the sector byte count? Where is the directory & VTOC... all that stuff.

>Andreas Magenheimer magea000@mail.uni-mainz.de requested:

When you say sensor, are you refering to something like the "mindlink"? I've been looking for something like that, although I've never heard of the software you mentioned. I've played necromancer on my 8bit, I think you can find it at holmes and natties page

http://freehosting2.at.webjump.com/32fc323eb/at/atari-webjump/atari0.html

I think this link works, Mo.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

I need an ST-Mouse Driver for the ATARI 8 Bit, that runs in the VBI. Can anyone give me the source-code of such a driver?

Mirko

4990. 1050 Disk Drives- common problems and solutions?

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-07 20:14:16 UTC
From: Nigel Henry <nigel.henry@virgin.net>
Message-ID: <j0Yb7.23258$hs5.3752306@news2-win.server.ntlworld.com>
Source record: 34764

Hey there. My 1050 drive has just died on me, and I was wondering if there was any information out there to help me repair it. Since we are all dependant on this piece of essential hardware, and with replacements VERY hard to come by these days, it might be a good idea to try and put all the info about it in one place somewhere.

Maybe someone has done this already? I'd sure like to know where it is if they have!

Anyway, in case any of you have a solution for my specific problem, here it is:

The drive was working fine when I last used it about a month ago. Yesterday I set it up and the power light comes on. However, the drive mechanisim does not start at all, the busy light does not come on, and the stepper motor does not move the head at all. No mechanical activity from the drive mechanisim whatsoever.

Sounds pretty bad, huh?

Someone help...PLEASE!

4992. Atari 1050 repair UK?

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-07 22:40:25 UTC
From: Chris Cox <cbcox@no.spam.com>
Message-ID: <9kpqpi$is6$1@neptunium.btinternet.com>
Source record: 34766

Does anybody know where I could get a 1050 repaired in the UK for a sensible price?

The drive doesn't read any discs despite appearing to "go through the motions"

I get a timeout when formatting etc.

Hi Mirko,

Check out: ftp://ftp.spudster.org/pub/Atari/CTH/Utilities/Files/Mouse/
. Both mouseint.arc and mouse.arc contain information and programs for the
mouse that are interrupt driven.

Best,
Tom

Check the mech and see if the drive belt is broken. I have what I think is
a fully working drive which the belt has broken. If your drive electronics
is fried, I could sell you my beltless one for 10 bucks plus shipping.

4995. Final CGE Update, 7800 Encryption

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-08 02:01:19 UTC

Classic Gaming Expo 2001 Update 8-7-01

This is the final update for Classic Gaming Expo 2001 as all of us are heading out to Vegas in the morning to get things set up.

Hope to meet many of you at the show and if you're having a party, watch out. We love to crash them. :)

****

Dragon's Lair 3-D Update!!!

Legendary animators and Dragon's Lair co-creators, Don Bluth & Gary Goldman, will be appearing at CGE 2001. They will be joining Rick Dyer and John Pomeroy, both of whom had already committed, for a video presentation and keynote speech.

This is the first time the four creators of Dragon's Lair have been together in the same room since 1983!

NOTE All CGE attendees will be eligible to win one of two signed animation cells provided by the guests. One will be from Dragon's Lair and the other from Shadoan (Thayer's Quest).

The guests will also be bringing movie size Dragon's Lair and Space Ace posters that they will be signing.

****

Atari 7800 Encryption Program Released!

We've decided to kick off the festivities early and get everyone into the CGE spirit by releasing the 7800 encryption generation program. This is the actual program used by Atari to encrypt 7800 games and came right off of the hard drive that they used for this purpose.

Stop by http://www.cgexpo.com to download your copy of the encryption programs. Now let's see some new games!

****

New Alumni Guests Signed On!

We've added some great new guests since the last update. Here's some of the new celebrities that have signed on:

Jay Smith - Creator of the Vectrex
Joe Decuir - Father of the Atari VCS
Dan Kramer - Father of the Atari 5200 trakball

Susan McBride - Graphics Artist for Atari coin-op, Lynx, and Jag
Mark Turmell - 2600 Fast Eddie, Arcade Smash TV, NBA Jam, NFL Blitz

...and many, many more.

Check out the latest list at:
http://www.cgexpo.com/guests.html

****

We're sad to announce that the Father of Videogames, Ralph Baer, has been taken ill and will not be able to attend CGE 2001. Ralph has been with us from the beginning and we will certainly miss him this year. Please join us in wishing him a speedy recovery!

****

As mentioned, we're on our way tomorrow morning. We look forward to meeting everyone at the show so please be sure to stop by and say "Hi" when you get to Vegas.

Have a safe trip and see you there!

Regards,
John, Sean, & Joe

4996. Re: My-DOS Utilities...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-08 02:41:24 UTC
From: llpwhite@cs.com
Message-ID: <20010807224124.11261.00003053@ng-fv1.news.cs.com>

>That is a pretty big order... making them smart enough and versatile enough to suit your requirements involves too much coding...<

This was also my first thought after reading the original post. One of the first things that would be needed is a list of the "magic" memory locations used within MyDos 4.5 (and hopefully the same in 4.53 and 4.54). They're in the source code, naturally, but has anyone ever seen a list (so it doesn't have to be gleaned again)? As I would view these utilities (probably more than one), they could be written in pretty much any language, although being able to invoke directly from the MyDos menu would weigh in toward stand-alone executables (Action!, ABC compiled Basic, Quick!, or maybe one of the Assembler toolkits). I would also think that some of the many Sparta Dos utilities could be modified rather than start-from-scratch code.
Larry

as I can remember, there was an articel in the famous german "ATARI
magazin" ... but please - I don't know anymore in which month. Well,
just look for the "Assemblerecke" and check out the atmas-II sources,
very well documentated and yes .. a very fast vbi implementation.

but wait... i think compy shop did a mouse-driver to, usable in basic
(as you will need it?) .. it's very fast too, and can be found on an
old compy-shop disc-magazine...

sorry, for the unprecise information, but could be a hint :-)

Yes, I know. From this magazine, I typed in my actually mouse driver (for BOSS-X). But this driver in not a VBI-Driver, this driver is a normal driver, that is called with USR and stops by clicking.

Hi

Do "Fast Forward" have a website? Any details appreciated!

Julian

5005. Seeking recommendations for 8-bit Atari online info.

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-08 14:01:28 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0108080601.699a126f@posting.google.com>
Source record: 34779

Can anybody (or everybody) recommend good sources of information on
Atari 8-bit computers on the Internet. I recently bought an Atari 800
w/ 2 810 drives, for nostalgia sake. But, they came with virtually no
documentation.

I am looking for online information on:
(1) Online (printable) manuals
(2) Atari DOS
(3) Atari hardware users manuals
(4) Atari Basic/Assembler documentation
(5) Good sources to buy 8-bit hardware and accessories
(6) Any other sites you have found useful

Any suggestions would be appreciated.

Thanks,
John

Hi
I've been looking for a html-ized or pdf-ized version of
ZAP! THE RISE AND FALL OF ATARI with no results.
Does anyone know a link where I can find it?
I think I'm not the only one interested on it.
Thanks for reading...

Dr. von Byte

>
>
Thanks for the offer, but I am in the UK, so shipping could cost a LOT!
I have checked the mechanisim, and as far as I can tell it's in good shape.
The belt is fully intact. When I said that there was no activity from the
drive mechanisim when I power up, I meant NOTHING! The drive motor does not
spin, the stepper motor does not move, and the busy light does not come on.
The only indication that I turned on the drive at all is the power LED.

Still hopeful that there's an answer out there!

Yep,
but some guy from mirage told me officially, that all Atari-8 Bit Mirage
games are freeware now !!! (It was the "Mirage Production manager2,
since these guys still release games - for the PC!) Released this news
through ABBUC, so now everyone is allowed to make copies of mirage games
(if he know how to remove the copy protection). Of course you can also
find copies on many polish sites, try searching the game under the name
"Problem Jasia" (english: Johnny`s problem)... -Andreas

Message-ID: <3B718089.CD11887D@mail.uni-mainz.de>
Source record: 34789

Well,
I do not want a universal tool that fits all these needs. Maybe some of these tools are already avaiable for MyDOS or maybe some existing DOS 2 tools can be upgraded in such a way, they will support higher MyDOS densities and subdirs too. You know, when you have deleted a file on a 16MB MyDOS partition, there is almost no tool to undelete, no tool to recover a whole directory, no tool to count all files in this 16MB partition, etc. etc. Ok, there is however SpartaDOS and all mentioned apps are avaiable for SpartaDOS. But I never worked much with SpartaDOS and I do not like it very much. I would like to stay with MyDOS, but having a harddisk now, I have quite some trouble because of the lack of good MyDOS harddisk apps., that support 16 Megabyte partitions and subdirs... -Andreas

Message-ID: <3B71817C.6B9F2CFF@mail.uni-mainz.de>
Source record: 34790

Well,
one VBI driver can be found on the Mega magazin of Freddy Offenga
(forgot which issue). I also found one on the old Compyshop magazin,
together with source !!!
(Don`t know, if the Mega-Mag driver has a source, the Compyshop driver
has an assembler source, coded in Bibo-Assembler/Compyshop-Assembler of
course). Maybe the KE mouse-tool-disk also has a VBI driver, I have to
take a look...
-Andreas.

5018. New version of Atari JPEG viewers released

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-08 18:58:23 UTC
From: Raphael Espino <rjespino@yahoo.com>
Message-ID: <m3k80enzu8.fsf@islita.localdomain>
Source record: 34792

The latest versions of a8jdpeg and family are now available:
http://a8jdpeg.atari.org
http://a8jdpeg.webhop.org

Please note the new URLs and update your bookmarks! The nbci site has
NOT been updated and will probably disappear. a8jdpeg and family are
based on the C=64's Juddpeg (http://www.ffd2.com/fridge/), written by
Stephen L. Judd.

There are now 3 versions available:
a8jdpeg - Original Atari 8-bit greyscale JPEG viewer
JpegView - Friendlier version of a8jdpeg
JpegShow - New slideshow version

The changes made:
* Fixed HIP mode save bug
* Fixed Micropainter mode save bug
* Fixed decoder problem when a DRI segment with restart interval of 0 is found
* Fixed problem with right hand side of images being darker in some modes
* Improved SpartaDOS/BEWEDOS support (but see note):
- SpartaDOS style directories supported in directory list
- Added support for SpartaDOS '>' directory separator in filenames
- Fixed crash when returning to SpartaDOS
* Assorted minor bug fixes and improvements

Note:
The (64K) display modes use the RAM under the OS, and hence will crash most
versions of SpartaDOS. These should work fine with BEWEDOS though.

Comments, suggestions, bug reports, etc. are welcome. (Yes, the colour
version is coming =).

URL:
www.atari-area.prv.pl (or was it ftp ??)
Once there (takes an hour or so), look for "Kolekcje" (Collection) right under this word you find RIP. Click onto RIP, wait another hour and then a new page comes up. Has a nice polish text (we do not read it!)... and some fat and underlined words (links!):

- Visage (RIP viewer) click here to download this viewer...
- Procedur (procedure) click here to download some source stuff
(get to know more about RIP; Sources ??? -looks like PC stuff...)
- RIP01...RIP09 click there to download one of nine (9!) avaiable RIP archives.

Good luck and enjoy !!! -Andreas.

Hi,

I too had these problem way back in 1987 after ordering a HD system from
CSS. A friend (Technoid Mutan) introduced me to Sparta dos and just a
short time I was in love with this dos. I even ram the Pro BBS system for
11 years. There are many version of Sparta dos these days and the version
I use all the time is X32gx.dos (not mux compatible) all other version work
with the multi-plexer.
I have 2 dos sub-dir on my first partion filled with over 200 external
commands like Xmove/Deltree/FTD/TDline/
Xtype/Cleanup plus the great files by Tom Hunt like Rcopy/Rdel and unzip.
To tell you the truth, I probley would not use my 8bit with out Sparta dos.
I still save a pratition on my HD's for Mydos (there are a few programs that
need it) So give Sparta dos a chance, you'll love it.

The 850 was essentially an interface box for the 8bits, it had 4 RS232
type serial ports and the usual centronics style parallel printer port.

I'm not the originator of this message, and no, I don't have such a list. But there is one very annoying aspect to MS Works. To my knowledge, there are no other word processors or spreadsheets that can import files saved in the proprietary MS Works formats. True, you can export from MS Works if you know in advance which other program you will be using to work on Works files, and that program is on the list of "save" formats in MS Works. But it's darned inconvenient for people who start out with Works and then want to use something a little more elaborate.

But now we are WAY off topic!

If that were the case, the drive would spin and make a rapid clicking noise (the head banging against the sensor). I had a drive that did that and I used a sensor out of another drive that was presenting the same symptoms as mentioned here to fix it. I suspect that it's probably a broken trace or perhaps a chip that needs reseating.

The 3 most common problems that cause this on the 1050 are in
order of frequency:

1. Bad 6810 SRAM
2. Bad FDC
3. Bad Regulator section component

Check the power pins of the components on the main board to see if
they are getting 5V+. If they are try swapping out the RAM and FDC in
that order.

The SRAM is still available cheap from a few mail order places,
the FDC will cost you $5 - $10 at a surplus electronics outlet like BG
Micro.

There are still some vendors like myself who will take 2 broken
units and return 1 working unit for the cost of shipping. Since your in
the UK you might want to check the Vendors FAQ to see if anyone offers
this in your area.

Steve

Well I couldn't stand it anymore and I opened it! The sweet smell of air from the eighties filled the room. Brought back memories of when I bought my software at Sears in the Atari section! After doing a pro image, I got the report of four bad sectors. Using my Happy drive to copy it four short sectors showed up. The Happy did make a nice copy though. Looking at the manual, it makes no qualms about telling you not to try to copy 'at the risk of destroying the data on the disk and voiding your warranty'. That's not the only inconvenience, to use the mem.sav on a work disk, it must first be 'prepared' by formatting,writting DOS files, creating a mem.sav, and then copying CIOUSR and DIR from the microsoft disk. Evidently this makes some kind of write to the mem.sav file. To run a program written in this language, you must first boot Atari Microsoft BASIC, and then switch to the program disk (if you only have one drive). That kind of makes it impossible to distribute programs written in this language if none of the recipients have the program disk. Probably why it wound up disappearing into the void of obsolescence.

> use and for hobbyists. How would such a system look?

I would go for something very simple: a very compact hand held or palm pilot type machine with a 6502 or 65816 CPU, either 4 or 8 megs of RAM, 320x200 / 640x400 LED display, a GEOS or Palm OS type operation system: it would include both a kernal layer and a GUI layer so that the GUI can be shut down by a program. It would be a machine that could be used for something like a Gameboy
or a Palm Pilot but would include lot of IO ports for external extras like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM, printer ect. and can be used as a simple home computer or web browser as well as a control module for other hobby projects.

I would also include a built in assembler and another simple high level languge like BasicX (which will allow inline asm like Turbo Pascal does).

Oh, yeah... if possible I would also include network support so that these hand held computers can be chained together. Maybe infrared IO too.

Open the drive (carefully...), locate the pressure pad (wiggle the drive lock mechanism a few times while peering inside) and (even more carefully) rough up the surface of the pressure pad (but with material falling into the drive mech) or pry it out of its holder and replace it with one crafted from the pressure pad of an ordinary audio cassette with a tiny dab of superglue.

After many years use, these pressure pads become compacted and aren't able to press the material of the disk against the read/write heads sufficiently for the data to be read. Careful dressing of the pressure pad usually solves the problem.

Good luck!

Hello all,

Well I am off to the CGE in Vegas. Taking the kids with me. I know they
will have a blast as will I. I hope to buy some neat things as well
take alot of nice pictures. I hope B & C will be there again. They had
alot of nice things for the 8-bit computers. Take care....

5043. Getting disk images to 1050 disk...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-09 14:10:24 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <NniiyTGQnpc7EwG5@lovecraft.demon.co.uk>
Source record: 34817

Okay, I know about APE and such - but my Atari isn't remotely near a PC!
How can I make new disks for games from downloaded images? I seem to
have hundreds of unlabeled Multiboot disks, many of which don't work,
but I can't find MULE anywhere!

Can I just get one of my 1050s, a PC-SIO cable, and write disks using a
PC utility?

Richard

> I would go for something very simple: a very compact hand held or palm
> pilot type machine with a 6502 or 65816 CPU,

Or for $10 more, you could have a 200MHz StrongARM processor or similar in the device, along with easy, cheap support for the interfaces you list below.

I like ARM processors, and really want a fast XScale based laptop or computer. Not much chance of getting one soon though.

> either 4 or 8 megs of RAM,

For a handheld device, low power memory is essential. Hitachi just this week released an 8MB memory chip that uses 30% less power and is even faster. Given the cost of memory, it makes sense to hit the sweet spot in price rather than the cheap spot, and I imagine that could be 16MB or 32MB. Which is a lot for a handheld device unless you run WinCE. Which I wouldn't want at all. So lets spoil ourselves anyway.

> 320x200 / 640x400 LED display,

If you have a keyboard on the device (like a Psion palmtop) then a 640x240 half-height display (Psion 5) or 640x480 display (Psion 7) would be great.

Without a keyboard you would have a conventional palmtop display of 320x240.

> a GEOS or Palm OS type operation
> system: it would include both a kernal layer and a GUI layer so that
> the GUI can be shut down by a program. It would be a machine that
> could be used for something like a Gameboy

Palm do have a very good frontend for launching software on a palmtop device. The software choice is very good as well. The underlying OS is a bit didgy though, but they are moving to ARM, so hopefully they will sort these things out and get a solid OS in there under their GUI stuff.

> or a Palm Pilot but would include lot of IO ports for external extras
> like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM,
> printer ect. and can be used as a simple home computer or web browser
> as well as a control module for other hobby projects.

Yikes, where to put the ports on the device! I suppose it could have one of those laptop bay-extender thingies, which could have a DVD/CD drive, HD, etc in it.

Wireless ethernet would be a very useful feature.

Mouse wouldn't be necessary with a touch-screen system. A small portable printer for the device would be neat though - an A5 printer :) Still "neat" is not "needed"! Audio recording and playing is necessary, as is decent video, which palmtops really need. How about some 80's style graphics hardware trickery! Sprites, hardware scrolling, block mode graphics, etc, but with a 16-bit screen :) - then again, the GameBoy Advance has that and more now... maybe some lowend 3D hardware instead!

> I would also include a built in assembler and another simple high
> level languge like BasicX (which will allow inline asm like Turbo
> Pascal does).

That would be fun.

Graham

5045. See you at CGE with some rare Atari stuff

Newsgroup: comp.sys.atari.8bit

If you are going to be at Classic Gaming Expo I will be auctioning off a Tooth Protectors Atari 2600 Cartridge and a super rare Atari sound/light special effects console (hooks to TV, kind of like VLM for Jaguar only 20 years earlier) from the 70's! I may even bring a couple of rare IDSI boxed 800 xl game cartridges to trade! (I need Tapper, Matterhorn and Zeppelin carts for 800 xl)

I have the most highly sought after game for Atari 800 xl up for auction this week, MULE, complete with packaging and tested and working on 2 of my 8-bit drives. I just had a guy e-mail me and offer me $125 for it and I turned him down just to give everyone a fair crack at it! Don't forget to check out the 59 other super rare items including Atari 800 xl Bounty Bob Strikes Back, Atari 2600 Malagai, Dice Puzzle, Tapper, Atari 5200 Zaxxon, and tons more! Search for Malagai on the most popular auction site on the internet , the click view other auctions for the rest.

Thanks a lot for reading my post! -Satcom2

5046. Re: I need an ST-Mouse Driver for the ATARI 8 Bit

Source record: 34819

Will someone please explain to me how a mouse can be read in the VBI?

Each read of the mouse port can only detect movement of one pixel. There are only 50 or 60 VBI's per second, and the average mouse movement is much faster than that. When I implemented a little mouse driver according to an article in ANALOG (around '85, about connecting a mouse to the 8-bit), it required about 20 DLI's running down the screen in order to read the mouse properly.

The Atari mouse doesn't send its coordinates and it is basically a dumb device. If anyone can explain how a VBI-only driver works, I'd like to know too.

Itay Chamiel <itaycspam@cs.huji.ac.il> wrote:
> Will someone please explain to me how a mouse can be read in the VBI?

You just run the VBI for half the complete frame and then return
to the main program, and keep the mouse polling within this long time span.
Obviously, this will slow down programs by about 50% if you use half the screen
for the polling, and the mouse becomes *slightly* inaccurate since you miss
the ticks that are generated in the lower half of the screen.

There are also smarter alternatives, like a simple additional hardware
that implements up/down counters to count the mouse "ticks".

So long,
Thomas

Thanks Steve, some good ideas there. I checked for +5V on the mainboard IC's, and it is present on most, so we can probably rule the voltage regulator out. The only problem I have now is that I don't have a "good" SRAM or FDC chip to swap out. Do you think Best electronics or another supplier would sell me just these components? It would be a very small order.

I would dearly love to swap 2 faulty drives for one good one- now my last working drive has died, that leaves me with 4 faulty ones!

Thanks, Nigel

Howdy Atarians!

First of all, I don't get any money for that. It's just because I love *my* new Atari T-Shirt.

For all who are interested in buying atari merchandise, this is the only serious adress I found on net.

http://www.emerchandise.com/browse/ATARI/ALLPRODUCTS/

have fun with it!!

something else:

As I can remember, there was a list with movies, where atari products where placed. Where can I find it?!

And finally:

Are there other atari merchandise related retailers avail on net? I'm still looking for some cool posters with Road Trip movie and that guy who is wearing an orange t-shirt. ... of course an *real* atari nerd :-)

stay cool and play atari !!!

Sounds like something they should carry. If you cant find them
there try www.bgmicro.com, I believe they have no minimum order.

You could also try the chips from one or two of the dead units,
its unlikely that all 4 failed from the same fault.

> I would dearly love to swap 2 faulty drives for one good one- now my last
> working drive has died, that leaves me with 4 faulty ones!

It would cost about $50 US to send 2 1050's by Air Mail back to
the UK, and more than that to send 4 here. Probably a lot cheaper to
purchase the chips. =)

Good luck e-mail me if you need any help.

Yes you can build a ProSystem interface and use the ProSystem
software on your PC to talk to the 1050 and make an image of the disk.

There is also a program called 1050-TO-PC by Nick Kennedy that
uses a slightly different cable to accomplish the same thing.

You can get the APE/ProSystem software at the URL below.

Looks good. There are two cables, though - does that mean if I get a
ProSystem cable, I'd need to get another to use APE in the future? I
have a Compaq 386 Portable that would be ideal for leaving next to the
Atari...

> mechanisim whatsoever.

Please check the +5V and the +12V power supply. The +12V are generated by
a voltage-double circuit formed by the huge capacitors approximately in
the middle rear of the drive, and two diodes precisely between the
capacitors. These diodes are a bit too weak and like to "burn out" after a
while - they are IIRC 1A types, but you'd better go for 3A types. Except
that, no special type is required, a standard 3A silicium diode will do it.

The point is - this voltage doubling circuit feeds the drive motor and the
stepper.

So long,
Thomas

Hi, gang - sorry to drag you through this question again, but I'm wondering what cabling and software I'll need to transfer stuff from my original atari 800 w/1050 drive to a Win95/98 PC - I saw pretty pertinent-looking stuff on atarimax.com, but I need the basics of what the cable is, where to get it or how to build it, and what to do from there.

Anyone who doesn't mind giving me the overview again, I'd certainly appreciate it!

Many regards,

-Eric

I was one of the people who learned to do it without a special cable.
I used an Atari 850 interface (other equipment might do) and ran a
serial-to -serial "null-modem" cable to a generic DOS PC. I used the
PC terminal program Telemate (demo version available) and the Atari
8bit software Diskformer, by Ken Siders.

Diskformer is halfway down the page at:
http://home.columbus.rr.com/ksiders/atari.htm

I found Diskformer to be a great program and have written out many
disk images to floppy with it, and vice versa. I would also recommend
Bobterm as a good file transfer program.

Hey, Stan
If you do not have the 850, P:R: Connection or equivalent, then go to
Clarence's page:

http://members.nbci.com/_XMCM/atarimods/index.html

and check his articles on building the APE or SIO2PC cables and the links for
obtaining the software.

5068. ATMAS II manual

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-11 14:52:25 UTC
From: Frank Schroeder-Hoeftmann <frank_sh@web.de>
Message-ID: <9l3gg6$338$1@olaf.komtel.net>
Source record: 34842

Hi all!

For some reason I need to revise some old assembler sources I wrote in the eighties. I used to create them with ATMAS II. Though I was familiar with the program back then, I can't remember how to work with it now! Honestly, for the life of me. (-: I can't even load a bloody file! *lol*

Does anyone have a discription of commands or can anyone point me to an online version of the ATMAS manual?

Thanks,
Frank

>

I know what you mean. The only thing that brought me kicking and screaming into the 21st century was the inability to find a hard drive to run with my Atari 800xl. If I had a hard drive, I'd still be using it and talking about how cool it was that I could do anything on it that a 1990 IBM DOS machine would do, except 160% slower.

I got little benefit from Sparta-Dos on my XF-551's because I didn't know how to utilize nonAtari brand DOS.

I never knew that with Sparta Dos I could have loaded my 80-column fudge disk, and THEN loaded my Microbits modem cartridge to get 80-column telecommunications.I also didn't know how to load several 88k floppies onto one 360K disk and to keep them separate using directories (which DOS 2.5 didn't have).

Trying to find a way to access Atari BBS's brought me down. I couldn't download any 9600 bps modem drivers because the local Atari BBS rejected any inquiries slower than 2400 bps. Without the drivers on the BBS, I couldn't hook up a faster nonAtari modem to my 850 Interface module. Talk about Catch-22. I'd would have had to buy a PC anyway, just to get the stuff to make the Atari work. After I got the PC, I didn't want the Atari any more.

The Atari 8-bit is like your high school girlfriend. Sometimes you miss that old romance, but it is nice to be able to engage in adult behavior with your real wife (who is over 21).

Raleigh

[snip]

Larry, trust someone who's using a Dreamcast that the sales clerk was a
moron. The Dreamcast motherboard has RGB outputs, H-Sync, V-Sync,
Composite video, Audio, Chroma & Luminance pins. The Blaze and all other
VGA boxes simply tap the RGB and SYNC outputs, jumper a couple of pins to
tell the DC that it's in VGA mode, and converts the signals to VGA
compatable signals.

You will not be able to convert your Atari to VGA using one of the
Dreamcast VGA adaptors. Sorry.

5072. Re: Atari T-Shirt & merchandise

I bought a navy Atari shirt with white logo from Target several weeks ago
and was disappointed that the ink they silkscreened it with started to
crack and flake after just the first wearing (no wash)..

I took matters into my own hands. I scanned the image, loaded it into
Photoshop and changed the colors from white on navy to black on white.
Then I modified it further into two different color schemes. One was royal
blue on white and the other was a black outlined rainbow on white.

I printed each to a T-shirt transfer and had my local T-shirt shop transfer
them to shirts for me. They look AWESOME! Especially my wife's Rainbow
Atari shirt!

Oh, the shirt I purchased at Target?? It was taken back and with the
refund ($11.99 plus tax) I purchased my white shirt that received the
transfer ($7.99).

For some strange reason I have a Hofacker book titled "Program Desriptions I", which contains a detailed desription of ATMASD...

Here is a few commands for starters. Let me know what else you need:

1. After loading ATMASD.OBJ hit K for Colstart. This will bring you into the Editor.
2. Hit ESC to switch to Command Mode.
3. Hit r to read text file. Format: R <DEVICE> [NAME] ESC
For example R D1 :FILE will read a source file "File" from Disk 1. The .SRC extension will be added automatically.

The best way, if you want, would be to send the book to you. I can ship it to you for free (you cover the shipping costs)

Regards,

Chris Kmiec

There's a typo in your posting. The auction pictures clearly shows
2600, not 2800.

(PS the first time I saw the post subject, I thought it literally
meant 2,800 controllers and 2,800 carts, not the model number 2800
which is exclusive to Japanese console.)

Howdy folks

I'm looking for an Atari font (to replace the standard on screen font) that looks like the numbers/characters on LCD's (like watches etc.). Where can I find one?

BTW I was under the impression that changing fonts was one of those subjects every magazin had milked to the bone. When I checked my collection, I could hardly find an article. (I have all the ANTIC and ANALOG files)

One of those silly differences. Our 65XE's also have an ECI port. (Maybe
Atari liked us Europeans better than you Americans. :-)))))

In one of the Atari Classic magazines (from back when Ben Poehland still ran
AC. BTW I haven't seen a new issue of AC in YEARS) Ben Poehland explains in
great detail how to put that monitor jack back into the 600XL.

IIRC one of the traces you need for the Reset key are on the outside of the
mylar. You better check, as Ron suggests, that all the traces are inside the
connector. BTW have you tested the console keys? I knew the address to check
by heart, but I forgot. Damb, I shouldn't have bought new mylars.... :-)

Be sure top check the voltage comming from your power supply. My computer
showed a (spinach like) green screen with the occasional spike (white flash).
The green meant my transformer was not delivering 5 VDC, the spikes where the
result of the occasional 11 VDC (approx.) it would produce. Ough!!!

>again I am in search of the following tools for My-DOS:
>a) some Undelete + Recover program
> (undelete any deleted file/any density; recover any deleted
>Dir.+VTOC, deleted
> via Quickformat, Fastformat or Clear directory); should support
>subdirs!

This could be a tuff one.

IIRC systems that use a FAT will not overwrite deleted files untill the rest of the disk/partition is full. The Atari however looks for the first sector that's free. So deleted files are overwritten very soon.

Undelete would have to:
- set the filestatus byte to 'in use'
- check which sectors are still intact
- ask what to do if the file is no longer complete. Incomplete textfiles can still be used. Languages like BASIC often tokenise (encript) files to save memory (inside the computer and on disk), you'ld need special tools to recover these. Forget about incomplete ML stuff.
- built a new VTOC from scratch.

> b) a file sorter program (any files, any density; sort by name, extender
> or size); should support subdirs!

Sorry, MyDOS uses filenumbers when in single or enhanced density. Sorting them on screen would be easy. Sorting them on disk would mean that you not only change the order of the names in the directory, but also change one byte in every sector of every file which name has been moved from it's original position. In DD, MyDOS doesn't use filenumbers.

>c) a "delete Directory" (deltree) program, that deletes any directory,
>no matter if it includes files or other subdirs; any density of course!
>d) a "rename" directory program, that renames any directory or
>subdirectory, no matter where it is or what it contains; any density;

Those would come in handy. How about a MOVE command, that only moves the directory entry from one (sub)directory to the other, without the need to copy every sector?

>f) a MyDOS filecounter; that counts all files in any dir/subdir and of
>course in any density (sometimes you want to know how many files you
>have on a whole partition or in a certain directory/subdir.)

>g) a "tree" lister that lists the whole directory/subdirectory tree(s)
>on a drive or partition...

As long as we don't have this, try WHEREIS.COM (there is a MyDOS version. Try CSS or XLSearch) and enter *.* (to see them all) or some bogus name to see no names. It will tell you how many files and directories are on the disk/partition. But not how many files are in each individual directory.

>h) a highspeed or ultraspeed routine for various floppy speeders, that
>works correct under MyDOS and at least Single, Medium and Double density
>(most of all, a highspeed/ultraspeed routine that works with MyDOS and
>turboBasic XL!!)

Kay (grmmbl, I forgot his last name, he worked for ANG) once wrote a highspeed/ultraspeed routine for MyDOS. I know I have it somewhere. I've been looking for it myself. But I can not find it.

>i) a new disk formatting utility, that only lists these 6 formats:
> 1) Single (90kbytes) 4) DSDD 40T. (360kbytes)
> 2) Medium (130kbytes) 5) DSDD 80T. (720kbytes)
> 3) Double (180kbytes) 6) High Density (1440kbytes)
> so there would be no need to use MyDOS options O, P and I together...

Most harddisk interfaces have a menu like that.

>j) a harddisk formatting utility, that only lists the following:
> - sectors (x-65535)
> - drive (1-8) since D9: is always Ramdisk!
> and as soon as you press return then,the HD is formatted in MyDOS
>format.

NO, include D9: just in case.

>k) a "move" file utility, that moves a file to another dir/subdir (and
>then deletes the source file); should work with any density...
>l) a "move" dir/subdir utility that moves a dir/subdir to another
>dir/subdir without the need of copying (just rewrite the links and
>such)...; should work with any density...

A yes, I should have read all of this....

>Maybe these MyDOS tools already exist (at least they all exist for
>Sparta-DOS!!), if not I do hope someone is willing to program some of
>them soon... -Andreas.

You have some great idea's. Let me give you the advice I keep hearing over and over and over again. "Try learning Assembler". :-)

Well,
you wrote "Battlespheres" ??? You have more than one Battlesphere cart
???
ARRRGGGGHH !!! Those idiots did not sell any carts (officially) to
europe, allthough I ordered some (and many of my friends did too)...
Now, if we take a look at Ebay we have to pay some 500 or 1000 USD for
this game. Simply too much for me. Thats why I call the programmers
idiots - guess what happens, pirated ROM images will be avaiable (and
used) sooner or later. And when you cannot buy this game, you merely
have the chance to rip it... -Andreas

P.S.: They promised to do a second run of Battlesphere carts, but now I
am waiting already 3 years (ordered again!) and nothing seems to
happen...

Check out the Diskfix.COM program of Turbo DOS (from Reitershan, i.e. a
german DOS). it does all this stuff very good and very fast. it even
checks if a file is text, tokenized basic, listed basic or ML file.
otherwise the file simply gets the extender .REC and you have to find
out yourself. Unfortunately this tool is limited to Turbo-DOS, thats
360k density max. !!

>

Nope, MyDOS only uses sector links in Single density (90k) and double
density (180k). Thus, only single and Double are fully DOS 2 compatible,
all other formats do not have sector links. I do not know what sort of
"link" MyDOS uses, but it has to know which file or which Dir/Subdir
belongs to which sector...

It was Kaj de Vos (ANG ??? Pokey ??? SAG ???), he did not release this
tool officially, thus all ABBUC members were asked not to use it any
longer (well, Wolfgang put it on the ABBUC mag. thus more than 500
members have this tool!). But: this US-routine always asks for an adress
where it should run from, then returns to MyDOS. It surely does not work
together with Turbo-Basic XL. I have tried it, I also tried dozens of
other US-routines. Most of them seem to work at first, but as soon as TB
loads, these routines get turned off...

Well, I have two interfaces (no black Box!), one being the MSC interface
and the other one from Sijmen Schouten. Both do not have such a menu
program !!! Not for MyDOS !!!

> >j) a harddisk formatting utility, that only lists the following:

Afaik, D9: is always the Ramdisk (for both Sparta and MyDOS), have not
tried it with a drive/partition however... Maybe it works...

Well, if that would have been the only answer all over the years, I
would have left the Atari scene long ago. I even cannot program in
simple Atari Basic, how should I learn/understand Assembler then ???
-Andreas.

Source record: 34680

Hi,

I have an old PC with a 5.25" disk drive. Does anyone know if it
is possible to write an atari .ATR image file to a disk in that drive
so that I can then use that disk in my Atari 810 drive?

The BlackBox has :-)

If you can use those formats from Basic with a XIO# call, it should be no
big deal to write a quick hack into assembly (less then 400 bytes exe-file
I guess).

: > NO, include D9: just in case.

: Afaik, D9: is always the Ramdisk (for both Sparta and MyDOS), have not
: tried it with a drive/partition however... Maybe it works...

It works. The BlackBox, MSC and the KmK interface all support diskdrive
redirection. Some o.s. also do, and DOS 4.0 (QDos/AnticDOS) is also able
to redirect a drive ID.

You "ordered" some? How did you do that? The game has never been available
for "order". When the carts were ready, Scatalogic made an announcement and
issued confirmation numbers to the first "x" number of responses. That was
it.

> happen...

You've been waiting 3 years for the second run? The game was released for
sale for the FIRST time in March of 2000! Do the Math!

Since the first sale of carts, the game has been offered by Scatalogic 2x on
Atari.net auctions. The second set of auctions were cancelled when the site
went down for some time during the auction.

You are very confused...

5116. Re: Article on Atari BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-14 00:52:30 UTC
From: Itay Chamiel <itaycspam@cs.huji.ac.il>
Message-ID: <9l9p2k$m8k$1@news.huji.ac.il>
Source record: 34686

Hi,

There are two major errors in the article:

"Eventually Atari just left the [right cartridge] slot out of newer machines because no one was using it, permanently leaving an 8k hole of unusable memory in the machine."

This is simply not true. Assuming your machine has 48K or more RAM, if there is no cartridge in the right slot then its corresponding space in memory is free RAM, not unusable space.

"Three years later Atari was releasing a new machine called the 1200XL and decided to fix this problem while they were at it - along with a very few others."

This insinuates that the 1200XL has built in BASIC. It doesn't. Only the 600XL and 800XL had the built in BASIC which included the bugs you describe (known as "Rev. B Basic").

You also didn't mention that the BASIC shipped with the later XE's was fixed (Rev. C).

Good article though :)

Well, the power for my Atari is actually pulled from my PC's power supply
(they have 5V and 12V in there, so why the heck not use it?) so I assume
it's a proper 5V judging by the simple fact that my Windows machine is
working well with it..

I've since discovered that the color pot is accessible by opening up the
cover of the machine, and the colors are ok now. Thanks though :)

(Yes.. My PC computer is the power supply, disk drive, modem and display for
my Atari, when I use it.. The only actual Atari hardware I need is the
computer itself.)

:)

Not unless the PC is really really old; most of those units for the last 16
years or so do not have a single density controller. Even if the hardware
was willing, I have not seen any PC software for the purpose. There are a
couple of double density apps for writing files to an atari DD floppy on a
PC 5.25 drive; the ones I have seen will format but not write DOS files...

We bought it separate (about $16) with the 400 in 1983. Satisfactory for starting out in A-8 Basic and it cannot be that rare as I now have about 4-5 copies. Poole's YAC is the better resource.

Argh! I meant "Your Atari Computer", of course. I guess I should also mention that the Weber books (XL User's Handbook and XE User's Handbook" are pretty decent, but still not as good as YAC.
Larry

```
And at least 2 more...
1. "This even had another advantage, a numeric constant would always take up
6 bytes of memory, but a string representing that constant only took up the
number of chars it was long."

Variables used one byte for each time used plus the length of the definition
plus the 6 byte value of the contents.

2. "... strings were indexed at 0 instead of 1, so you had to change all of
the offsets."

Atari Basic strings always start at position 1: A$(0) gives an error every
time. Their format was different but basically simpler and more general. You
had to rethink string arrays:
1020 PRINT A$(R)
became
1020 PRINT A$((R-1)*LENGTH+1,R*LENGTH)
and did not require the laundry list of print statements with line # math.

Vintage Computer Festival 5.0
September 15th and 16th, 2001
Parkside Hall - San Jose Convention Center
San Jose, California
http://www.vintage.org/2001/main/

Mark your calendar! The fifth annual Vintage Computer Festival is scheduled for the weekend of September 15th and 16th at Parkside Hall in San Jose, California.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

EXHIBIT YOUR VINTAGE COMPUTER

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. First, Second and Third place prizes will be awarded in 13 categories, including the coveted Best of Show.

For complete details on the VCF 5.0 Exhibition, visit:

http://www.vintage.org/2001/main/exhibit.php

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. If you would like to rent a booth or inquire about consignment rates, please send e-mail to <vendor@vintage.org> for more information or visit:

http://www.vintage.org/2001/main/vendor.php

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the VCF 5.0! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

http://www.vintage.org/2001/main/vcf50.doc

Although I have reviewed the rules, I remain a little bit puzzled
if it is acceptable to embed machine language instructions inside
of the arguments to a PRINT statement, and then have them executed
in screen memory after printing? And how much mangling of the BASIC
is permitted? Is it acceptable to have lines that approach 255
bytes in length?

5128. WTB - Atari 800 or similar.

Anyone out there have the above system and peripherals for sale? Prefer Australian seller, but would consider overseas.

5129. SIO2IDE interface for 8bit ATARI

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-14 08:30:33 UTC
From: Marek M <marekm@aritech.com.pl>
Message-ID: <9laoi9$1ej6$1@news2.ipartners.pl>
Source record: 34703

I would like to introduce my SIO2IDE interface for 8bit ATARI.

Interface has the following features:
- standard SIO speed 19200 baud
- emulates ATARI disks D1 to D15
- max 16 partitions, each 16MB
- easy to build and install inside your ATARI
- interface software and utilities are available for FREE

Please look at: http://www.atari.cuprum.com.pl/ (SIO2IDE), only in
Polish, sorry.

English version of the SIO2IDE will be available soon.

P.S. PCBs for the SIO2IDE will be available in September.

Regards,
Marek Mikolajewski
Gdansk Poland

Subject: Re: Is possible to write an atari formatted disk to 5.25" disk drive in Windows PC?
Date: Tuesday, August 14, 2001 11:13 AM

As far as I know, I'm the only person to write a PC program that
will format A8 and write DOS files to a PC disk drive. Dbl dens.
(Oh heck, Who wrote MyDOS? Charles Marshand) Anyway
the guy who wrote MyDOS wrote 'Myutil' which will format
dbl dens disk in PC and write MyDOS style files to it.
One thing I know, format the disk using the PC, Don't use a previously
formatted disk, unless it is totally erased with a magnet. Use only
Dbl Density disks (usually with hub ring), HD (1.2 meg) disks will
not work. I have a lot of experience with writing A8 stuff using PC.
My program will write either MyDOS or SpartaDOS boot disk
using a PC. It is still somewhat 'iffy', but I have done it and
successfully
booted from a 1050.
Much better to get a dbl dens A8 drive (that works), US dblr 1050, Indus,
Rana. And even better yet to use a APE or SIO2PC cable.

From: Maury Markowitz <maury@remove_this.sympatico.ca.invalid>
Message-ID: <sNae7.4560$hO5.885030@news3.rdc1.on.home.com>
Source record: 34711

I've suddenly become interested in the Atari again (it waxes and wanes) and started poking about on the 'net. Too bad we didn't have that in the 80's...

Anyway in my BASIC article I talk about the math functions sucking so bad, and express my interest in the fact that they never got upgraded. So I was reading the hardware FAQ and noticed that there are a whole bunch of OS upgrades out there. I have some questions about them.

In general the upgrades can be divided into a couple of main functions:

1) replacement math routines
2) replacement graphics routines
3) an ML monitor
4) extended RAM support
5) support for faster disk I/O

I was wondering if anyone can expand on these?

1) Did the FP routines use a trap table? If not, did the replacement routines have to be exactly as large as the originals? In the FAQ some of the OS's have the fast math and some don't, is this expected? What sort of performance boost do you get from these upgrades?

2) I have basically no information on this. Anyone?

3) I would have loved a ML monitor on the Atari, I consider it to be one of the flaws of the system that it didn't include it. Does anyone have any dox for any of these (Omnimon or XL Boss).

5) what exactly happened with these? With something like the US Doubler you needed to use Sparta to get the speed. May I assume in UltraSpeed + they simply moved those routines into the OS? If so, did that mean you got the high speed support on all of the DOS's?

Maury

5139. What exactly changed in XL OS to break it?

you should also provide the flyer in other formats, StarOffice comes
to mind as it is available for most platforms and does not lmply that
an event such as this is for windows users.

I think this is my best auction yet for Atari 8-bit games, I have lots of games that are avalable at no dealer on the web, and many are boxed and complete. Bounty Bob Strikes Back cartridge, Mario Bros. for Atari XE, Ultima 4 with box, tested and working, MULE in beautiful condition complete (the original sim-game!), Zombies boxed with mint disk and manual, Diamond Mine cartridge, Temple of Apshai complete boxed, and lastely Telengard boxed (Telengard has a NON working disk though).

Here is the link for MULE:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1263277493

TRADE LIST!!!

I need the following game cartridges for Atari 800 xl : Gyruss, HERO, Megamania, Decathlon, the Designers Pencil, Keystone Kapers, Pitfall, River Raid, Zone Ranger.

I have these FOR trade, only for games on the above list and only using common sense as far as value. Here is what I have:

Pool 400 boxed complete cart, Survival of the Fittest boxed complete, Return of the Jedi cartridge shrinkwrapped boxed, or use the above games that I have in my want list for credit towards any of my auctions! I will give a very fair amount for them, and yes I know which ones are hard to find (Gyruss, HERO) and give much more credit for those compared to, say, Pitfall.

Thanks a lot for reading my post! -Satcom2

I've an 800 XL w/box - no power supply. You'd need a 240 volt PSU anyway.
Also have 1010 recorder w/box no PSU and a volksmodem 300 baud DCM w/PSU.
I'll let it all go for $50.00 US + shipp.

Welll.... one could argue that SO can load DOC files well enough.
However, the best format would be HTML or PostScript, as those are
fairly accessible.

A PPM/PGM/PBM file might be good, too... one could generate a converter to
push it out into something loadable by vintage computers (such as GR8 or
Micropainter formats on the Atari ;))

On polish TOMS 720 Drive percom is correct: 80 tracks/256B/2 sides. All is
this
same as 360KB (XF-551) format, but is 80 tracks :) Directory is on sectors
(MyDos) $168 and $167 sectors. Contain:

04 33 0b 33 0b 00 00 00
00 00 0f ff ff ff ff ff ... rest of sector $168 = ff

sector $167:

ff ff ff ff ff ff ff ff - x14 times
ff ff 80 00 00 00 00 00 and rest=00

is 2867 free sectors

Vasco/Tristesse

There is a FREE IDE interface for the Apple II being planned on
comp.sys.apple2. It uses 7 74 series chips in the prototype. The prototype
works. People are now trying to improve it to automatically recognise tracks,
sectors, heads etc. So the rationale is sound for a niche computer.

Hi!

I've got an 800XL that appears to be almost functional. There is a
capacitor burnt out, C28, near the basic rom.

Unfortunately it is so crispy I can't make out what type/value it is,
can anybody help me?

Thanks,

5152. Re: What exactly changed in XL OS to break it?

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-14 21:23:05 UTC
From: Ron Hamilton <ronandjudyh@earthlink.net>
Message-ID: <ZEge7.10120$ZM2.925550@newsread2.prod.itd.earthlink.net>
Source record: 34727

The major alteration was moving the Screen Editor Get One Byte (EGETCH) and Put One Byte (EOUTCH) routines during revamp of the OS. Many coders (including some at Atari) had done JSRs to these, so called 'illegal', hard addresses in lieu of properly referencing the Editor vector table at $E400. This table of pointers was at a fixed location while their contents were subject to update. An early Analog details more as does the XL/XE addendum to Mapping the Atari on Kevin's site.

Now much better... and BTW, the reason Atari Basic could not use the "go back 10 bytes" during loops was its ability to alter the statement table on the fly as it executed by the POKE 842,13 dynamic editor or an entry like ENTER"D2:NEWLINES.LST". This was a creative and powerful use of extending the normally immediate mode commands.

Let's show a simple example.

In "The Atari Assembler", there is a program listing that prints a string to the screen via the standard "E:" device. It directly calls the OS routine for doing this rather than opening a channel via CIO - Basically you load a character into the accumulator and JSR $F6A4 ("gosub" to the routine at that address), load the next character and so on until the string ends.

This is one example of a program that will work on the Atari 800 but won't work on newer machines, because that address was undocumented. The "legal" way to do this was to look up the "putchar" vector in the E: device vector table, which was in a known, published location, and then use that found adderss (which reall was $F6A4 on an 800, but something else on other machines). The authors of The Atari Assembler, as well as authors of some programs, simply looked up the address on their machine and then used it in their programs - and therefore the programs broke on the 1200XL and newer machines.

This is of course, just an example, there are more: Writing values to PORTB that meant nothing on the 800 but which swapped the OS ROM with RAM on the newer machines, crashing the system, is another example that comes to mind.

Good article. But you left out one BASIC..."Microsoft Basic". Yes, there was a "Microsft" basic. It shipped on disk for the 800, and as I remember, it left a whole 12k for code. I used to have a copy. I don't remember it being that fast either. Thanks

The Night Hawk

Basic is U4 and the schematic I have shows C28 between pin 28/+5V of U5 and ground/pin 14 of U5. It is marked the same as C27 on pin 24/+5V of U4; both are listed as "100nF". I thought the "n" was an upside down mu, but C19, C20 & C22 list as "4,7uF" and a lot of others like C16, C17 & C21 have the "n"..? I could try to send you the .TIF file; it is about 2 MB.

Message-ID: <52me7.10227$KI2.998238@newsread1.prod.itd.earthlink.net>
Source record: 34733

It is the sector count and not the sector size which determines file number mode in MyDos; on a 180K DD single sided disk, it does use file position numbers in each sector. Only when the forward pointers would exceed 1023 does it dispense with file numbers. Enhanced has 1040 sectors, so no file numbers... Also, on a single density double sided (1440 sectors) disk, there are no file numbers. You would need 2 algorithms smart enough to detect the mode and utilize the correct proceduress.

Message-ID: <7fme7.10249$Kl2.1001233@newsread1.prod.itd.earthlink.net>
Source record: 34734

MyDOS uses a 16 bit link to the next absolute sector of the file in bytes
$7D (MSB) and $7E (LSB) (.. I know this is backwards!). It relies totally on
the Dir/Subdir for the location of the first sector and cannot refer back to
a directory entry from any data sector. It can't know which files belong to
a sector without reading all of the sector chains; I think that is what
VTOCFix utility does...

"Andreas Magenheimer" <magea000@mail.uni-mainz.de> wrote:
>

The only drive configuration you can control with XIO from Basic is Enhanced
using that 254 business, and it depends on the drive supporting the format.
Otherwise your format will be in the current status of the drive and not one
of your six choices. It will require SIO using the "N" and "O" commands
along with status and error checking to give you control and flexibility.

One book I always liked even though its not strictly for basic is "Mapping the atari", still very useful for 8bit programmers.

Nice interface, when formated with Sparta Dos the sio speed should be
around 54000 baud. Have you tried this?
I also need english version.

Thanks

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Here's another interesting one: The XL OS shadow register for GTRIG3 which
is used in the XL machines for the cartridge slot management (it's pulled
if a cart is inserted). The Os VBI checks the shadow register (uh, at $3fa,
maybe? Sorry, I forgot!) and compares it to TRIG3, and if both are not equal,
it executes an infinite loop. Unfortunately, this shadow register used to be
part of the printer output buffer in the old Os releases and some programs
used this buffer for their own purposes. Well, net effect is that the program
will "lock up" simply because the Os finds that the shadow register is no
longer equal to the hardware register...

So long,
Thomas

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 08/15/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 2.00 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 7.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 7.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 7.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I

collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

5172. The CGE Was Great

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-15 17:56:07 UTC
From: ebaiz@skyenet.net
Message-ID: <XIye7.15$SN.8900@newsfeed.slurp.net>
Source record: 34746

Hello All...

Just got back from the CGE in Vegas. Had a great time and so did my kids. I was able to be there both days and I must say the show was a hit. It was so crowded I hardly was able to play any of the arcade games that were there. I stopped by the SongBird booth and talked to Carl. I bought 2 copies of the Lynx version of Raiden. My kids and I loved the com-link support feature and were able to play together as I brought two of my Lynxes with me. I then went to the Good Deal Games booth and talked with Mike. He remembered me as I wrote the 800XLDJ article that his site has posted. He was real nice and chatted with me a long while. I also went by the B&C booth and noticed a new space game for the Jag being demoed. It was great and had great effects. They only had about 4-5 carts for sale, so I bought one for $60. The name of the game was Space Wars. Nice game and just as much fun as Battlesphere, just not the spectacular graphics. My 11 year old son won one of the competetions, namely the Dragon Spirit competition. He was the yougest winner as most of the others were at least 20-30 years of age. I also attended the Dragon's Lair lecture with Don Bluth and company. I even was lucky to get an autographed posted with Don's signature. I am going to frame that and hang it some where. All in all I had an excellent time and took alot of pictures. It was nice to see all those Atari T-shirts. I was wearing an original Atari shirt with "Atari" written accross it. I just cannot wait until the next I will be able to go. Probably in about 2-3 years. It you did not go, you missed out.

I picked up "Kaboom!" for the 8-bit at CGExpo (for about, err... $6 or $10)
and have to say, it kicks butt! :)

I mean, it's pretty much the same as the 2600 version (which was awesome),
it just has a spiffier interface (since it has the capabilities of a
full computer available ;)). The 'music' is amusing, too. :)

(although, I wonder... is there a way to turn it off?)

(hoping to get some 2player Kaboom!'ing in with his girlfriend soon)

5175. Impersonator

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-15 18:13:05 UTC
From: phantomm@bellsouth.net
Message-ID: <RYye7.1704$7K5.26759@e3500-atl2.usenetserver.com>
Source record: 34599

I have the Impersonator package by ALPHA Systems for the Atari 8-bits.

The software allows you to save Cartridges out to files on disk which can
then be ran by using the included DUMMY cartridge.

The Dummy cart is small and seems to have only a single IC on the PCB board.
The PCB board is covered with a white coating. Does anyone happen to know
what IC is used on the Dummy Cartridge?

Also, is there any software that will allow me to modify the saved cartridge
files so they will run without having to use the DUMMY Cartridge?

Has anyone else used the Impersonator lately? If so, will it work with
cartridges that are more than 16K?

I bought the package used years ago and it came with some disks that had
cartridge files saved out. One of the files is Bounty Bob Strikes Back!!
I was never able to get this file to run.

Was Bounty Bob Strikes Back a 16K cartridge?
And would it work on XL/XE machines?

Any tips or hints about using the Impersonator would be appreciated.

I am not familiar with that product, but Cart Clone appears exactly the same; that cart can make the RAM writable (normal) or look like ROM. If the code writes to itself and then reads to compare, it can spot a pirated file in RAM and crash. Essentially, you insert the cart, turn off the switch, boot the system, load your file, and turn on the switch.

The Cart Clone uses a 74LS04 in a simple circuit with a DPDT switch.

Any sector editor will let you look at the files, or a good disassembler, or ML monitor; the trick is finding the protecting code. Clever addressing modes can make it hard to identify:

```
LDA #$AF
STA $CB
STA $CC
LDY #0
STA ($CB),Y
```

That last instruction is actually writing to address $AFAF in the cart space using indirection.

It almost certainly will not work with carts larger than 16K, since most of them are bank switching more than 16K of code into parts of the 16K space.

I believe BBSB was a 40K cart so see paragraph above. The file would be about 320 sectors and require lots of patching. I believe it works only on the XL/XE series and not on the 400/800 OS. Anyone know for sure?

Nope, the 800XL has the 1200XL OS; all Atari did was release the Translator disk which turns off the XL ROMs and loads a 400/800 type OS into the underlying RAM.

Now what did MS BASIC do in these loops? Did it push the address of the
start of the line, instead of the line number?

Thank you for putting Envision out there! I had it (still have it) and loved it, although my disk drives died, and my computer got sick (but still lives). Now if I could only find a way to read my old 5-1/4" diskettes and recover all the work I put into those screens, I might be able to use Atari800Win to finish the graphic RPG I was working on all those years ago! :-)

They are quite similar, but a number of the vectors were changed (again!) from the 1200XL to the 800XL. I don't have a 1200 to verify this, but there was an article published in AIM back around 1990 or so that listed a number of vectors that were common causes of program crashes. It listed the vectors for the 800, 1200XL, and 800XL. (I remember the article, but have no idea where it is -- probably somewhere in my garage...)

A formatter might be a good starting point.
Conceptually something like this--
* Formatter is invoked from the MyDos menu.
* Program asks which drive to format.
* Program checks the Percom Block.
* Program displays the Percom Block data.
* Program displays the formatting options.
* User chooses the desired option.
* Program checks to see if the desired option agrees with current drive parameters.
* If different, program writes new Percom block to the drive. (I think there is a problem here, since MyDos will not know that the drive has been changed. IIRC, jumping through the warmstart vector (reset) will force MyDos to update its drive tables.)
* Program asks user to verify that he wants to format the drive to the current parameters.
* Program completes format and displays success or failure of format.
* Program asks if the user wants to format another disk/drive or exit to MyDos menu.
* Program brannches to beginning or exits back to Dos.
What errors are there in the logic? I also wonder about High Density formatting (as was mentioned before.)

No the package I have looks like version one. It has just a disk, disk holder sleeve for a binder, a reference card that sticks in the top of the comp. and a rather thick hole-punched manual. I must say the manual is very well done w/ high quality paper.

Mo

When running MSBASIC on my 800 w/48K, It reports around 22000 bytes of
'free' memory. The manual seems to imply that it's designed to increase
portability between different systems like the TRS-80 and the Commodore PET.

Working. Busy looking for a job. Blah, blah, blah, etc...

I'll try and do something this weekend. Something so outstanding that
C64 owners will be forced to weep and that will undoubtedly change the
face of gaming forever. Or re-write Pong. Er, or something.

Yes there are import filters but you know M$ does keep changing things
and Word is a frequent offender and keeps changing from version to
version. There are also some formatting problems with doc imports. A
postscript document would actually be best but PDF is really OK too.

Hi,
Actually, the $E400 is not a good vector. Remember, ther is the
HATABS table where new handlers are added or even replace existing
ones. That would be the correct place to get any vector pointers from.

I was thinking more of:
1Formatter is a .COM/.EXE file
2Requests drive # and code letter from a menu like:
S) SSSD (90kbytes) Q) DSDD 40T. (360kbytes)
E) Enhance (130kbytes) M) DSDD 80T. (720kbytes)
D) SSDD (180kbytes) H) High Density (1440kbytes)
X-exit
3Attempts to configure and format selected drive.
4Reports success or error condition
5Wait for another request or exit.
The response of "1S" or "3D" is parallel to the set density; we now just have Single, Enhanced, Double, Quad, Medium, and High densities.
I am not sure how you would patch it into the Dup.Sys menu..? And yes you just JSR to a JMP($000C), the DOSINIT vector, and MyDos checks any drives it knows about. That means we have to do a CIO call to the selected drive before the JSR, maybe a status request, in case the drive was not accessed since boot time or before DOS was written. After that we can do a CIO format so the FMS can do the VTOC, Directory, and Boot sectors.

John was asking about ***Atari 800*** hard-drives and my understanding
is the Black Box doesn't support the 800. If you have something at
your Atari store you didn't say so!

The Corvus system supports Atari 800.

5204. Re: Inexpensive VGA Convertors

I saw something today called a DreamCast RFU converter, that takes the Sega output thru a USB looking plug and generates a 75 ohm coaxial cable F-connector to a TV signal.

1) Will it run in reverse to make a complete RGB from the TV signal?

2) And could you drive an old CGA monitor with it?

I doubt it. Combining signals is easier than splitting them. Besides,
you'd have to demodulate the TV signal to a baseband video (composite)
signal first, _then_ split it into R, G and B components... A device
that works both ways can be built, but I seriously doubt that one works
like that.

>2) And could you drive an old CGA monitor with it?

Actually connected through joystick ports 3 & 4.

And there was one other system that supported the 800 for hard
drives. The SWP-8000 interface. It gave you the capability of
hooking up to four floppy drives, printer interface, and RS232
interface. And also the ability to run CP/M software (before
DOS existed).

There was an add on card that gave it a SASI interface (Shugart
Associates System Interface; pre-dated SCSI).

And there was even a PC card to add to it that enable you to run
IBM PC XT software and CP/M 86 software. The interface came
with a 8088 microprocessor and 128k of RAM. Expandable to
640k of RAM.

The SWP-8000 was a very good add on device. But they are
hard to find. And the add on cards I mention are even more
rare.

I used to have all of that, but I sold it years ago. But I still have
my schematics for it (just the SWP-8000 only)!

Was there ever a device that allowed any type of video to be grabbed using an Atari 8-bit computer?

I know that there were a few devices that allowed single pictures to be grabbed, but not sure about video.

Also, has anyone created a program that will display any video made from a ST-Falcon or PC such video formats like FLM, FLI, FLC, MOV, AVI, MPEG on an Atari 8-bit?

> it.
>

Ok, thats exactly how I did it. I "ordered" 3 carts via this
confirmation page. (Sorry, I am german, thus the word "order" easily
came to mind. Try to express it in german language if you can !!) After
the first carts were delivered, I did not get any reply, no info, no
carts, just nothing. So I waited. After quite a while, I could read that
there should be a second run. So I "ordered" or confirmed these 3 carts
again. Still waiting for them...
Finally I do hope, it does not take as long for the second run as it
took to program and finish the game (5-6 years if I remember correctly).
And yes, Atarians are always confused... -Andreas.

P.S.: Jaguar Rom images are avaiable through many polish homepages.
Since Battlesphere has not been delivered to Europe, it is not avaiable
there...

5216. Re: What exactly changed in XL OS to break it?

Well,
ABBUC floppydoc Erhard Puetz once designed the HDI (High-Density
Interface), which could use up to 4 floppies, each with up to
1440kbytes. He said, that MyDOS does merely work with 720kbytes and it
has to be patched in some way to use High Density also. But I do not
know, how MyDOS has to be patched to do so...
-Andreas.

Well,
there is one silly/funny thing: Here in Germany (or maybe in whole
europe) we use the name "Medium" for a Dual/130k Atari formatted disk.
Whereas "enhanced" is a PC format - it is bigger/higher than High
Density (i.e. you need at least a 32mhz crystal), formatting at
2.88megabytes... Ok, it never became a standard, since most (or all?) PC
3,5" floppy drives still format with 1.44 Megabytes... -Andreas.

P.S.: It is really silly, maybe atarians need not to care about it...

>I love the old 800. I connect mine to an old 386 running DOS and APE with that SIO2PC cable. <

Can you run at APE WARP (~3X SIO speed)? Certainly even at regular 19.2K SIO speed, it is very fast since all of the normal disk latency is eliminated. But 2X or 3X is truly impressive. If the new SIO IDE interface is successful, then putting an IDE drive inside an 800 should be pretty easy, and maybe even using a Compact Flash Card. (Notice how cheap they are now?) Also, IIRC, there is supposed to be another interface being developed that would work with 800's. (?)

No, I'm with you. I LIKE space shooters, and had been looking forward to it for a LONG time. The real thing just didn't do it for me when it finally arrived ... too little too late. I really wanted to like it -- it's fully buzzword-compliant, and the hidden JUGS stuff is somewhat intruiging as well, though much much much less than it would have been five years ago.

I guess I'm over the Jag in every way. Too bad that Defender 2000 doesn't seem to be coming to any other platforms (the new 3D remake doesn't count). And it's too bad that the NUON is destined for irrelevance as well. I bought the Tempest 3000 DVD but can't bring myself to get the buggy Samsung N-501 to play it.

5223. Re: What exactly changed in XL OS to break it?

It wasn't the always OS, it was mostly the crack/pirate program that caused the problem. The crack usually modified ramtop then opened the screen by jumping directly to the vector JSR $B6B3<or somewhere around there like $B3B6>. The proper way to do it would have been to set up the DCB and JSR CIOV.

Just about all the software the directly brokem like the Roklen cartridges, just did the same thing within their cart. They did stupid stuff like jumped directly to the put byte routines of the 800 OS vs use CIOV.``````````

Honestly ? I think the game was a big letdown, but it might be because I found it much more difficult to get into than Star Raiders. So, Star Raiders is STILL one of my fave games and scores above Battlesphere. Other games I'd like to see a good Jag port of, would be Lucasfilms' Rescue on Fractalus. That would rock on the Jag, if it's coded properly and keeps the same gameplay. Only better graphics and sounds. Oh, baby, that would I pay $300 for.

5226. Re: How Much a happy enhancement worth? What about an XF551?

If it's just the enhancement with no drive I'd give you $20.00, if complete w/docs $25.00. If it's an upgraded and working drive make it $40.00 - $45.00 I've seen them sell for $75.00 but not very fast.

Source record: 34505

(Wants know if 800 and 386 pc running APE can do 3x SIO speed.)
I don't know this question, but generally I use 'STUPID' to slow
APE down. I think my cable is too long and some may get reliable
3x 'Ape Warp' speed. The APE docs say SpDOS won't do
Warp speed unless it is the 3.2g version, which is my experience.
It is neat to hear the 3.2g boot at the high speed, but I can live
with 1x SIO speed. Also, my 256k and 130xe can't do the
3x speed, only my 64k machine.
I think APE could be more 'SMART' and be able to detect that
the 3x speed isn't working and fall back, but it doesn't it just
buzzes and doesn't work. I think James King reported his APE
setup was having troubles, and setting slow 'STUPID' mode fixed it
for him.
I consider APE Warp speed to be sorta a nice extra that really
doesn't work too well.

BS is not the best 1-player game in the world although I haven't played Alone vs. the Empire very much.

BS is really designed for multiplayer, but I doubt many BS owners have two carts and two jags and two eager players that often, let alone catboxen, etc....

I do actually have four Jags, two Catboxes, two Battlesphere, but I do not have anybody to play with :-(I'll have to play with myself (oops, what was that ?)

;-)

Well, what would you prefer as the menu choices? We can't use "D" for dual *and* for double, plus I went for some semblance of logic rather than A, B, C... It seems that Atari and Antic referred to 130K as "Enhanced" or "Dual" density; most of us called it @#$%&*(.

: Also, IIRC, there is
: supposed to be another interface being developed that would work with
800's.
: (?)

Yes, Sijmen Schouten from the Netherlands developed a cheap way to connect an IDE harddisk to an XL/XE machine (a bit the way Bob Woolley did it), and is now busy to do build such a thing into an Atari 800. Read all about it on http://www.atari.myweb.nl/

Source record: 34515

Russ Gilbert <russg@en.com> wrote

: (Wants know if 800 and 386 pc running APE can do 3x SIO speed.)
: I don't know this question, but generally I use 'STUPID' to slow
: APE down. I think my cable is too long and some may get reliable
: 3x 'Ape Warp' speed.

There are other factors involved. I've used APE at 3*SIO on 8086/8088 systems (old UARTs) with up to 7 meter of cable (shielded, that is) without problems, but other people reported they can't, even on 286 and 386 machines.

: I consider APE Warp speed to be sorta a nice extra that really
: doesn't work too well.

It's nice for booting-up a My-Dos games/demos image, but not when you want work with it when using Sparta-Dos. I have use the highspeed routines of my BlackBox and can use any version of Sparta-Dos at 3*SIO, which works o.k. when reading data with keyboard buffer disabled, but causes trouble on my 486 when writing to higher sectors on a large image. This is with the registered v1.18d.

I'm not to worried about it, since I use the BlackBox with SCSI HD for programming and such, and only use APE to transfer files between Atari 8-bit and PC system...

5242. Looking to trade Antic Magazines for other Antic Magazines

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-19 00:57:03 UTC
From: rosborn <rosborn@geocities.com>
Message-ID: <n43unts7e41k50a5jr17c270cgt6676f7q@4ax.com>
Source record: 34516

I have several duplicate Antic Magazines that I would like to trade
for other Antic's that I need to complete my collection. Let me know
if you are interested in trading.

What I have to trade:

Volume 3: 1, 11, 12
Volume 4: 2, 8, 9, 10, 11, 12
Volume 5: 1, 2, 4, 5, 6, 8, 9
Volume 6: 3, 4, 5, 6, 7, 8, 9, 10, 11, 12
Volume 7: 3, 4, 8
STart Magazines with Antic sections:
Volume 5: 4

Most are in fair to good condition. I'll provide details when a deal
is in the works.

Here's what I need:

Best of Volume 1
Volume 1: 1, 2, 3, 4, 5, 6
Volume 2: 1, 2, 3, 4, 6, 7, 8, 9, 10
Volume 9: 1, 2
STart Magazines with Antic sections:
Volume 5: 3, 7

Thanks.

That was a great game, especially with the paddle controllers.

If I remember correctly (I was about 13 or 14 when the 2600 was popular), you could "finish" the game. I did it once. The instructions said you would get something if you finished it and took a picture of the screen and sent it in. I took a picture of the screen, but you couldn't read it on the picture.

FamilyNet Newsgate

Whoa! This was the most unique application I've ever heard with the Atari
8-bits. :) Works for me.

As for me, I use my Atari 800 (and "890 ST Interface") to access local
BBS's for hanging out, and checking E-mail, newsgroups, and telnetting to Lynx
sites to surf the internet.
Every once in a while I load up games, which tend to be...

Archon
Spy Hunter
Star Raiders
Joust
Return of Heracles

A fun computer that I use on a daily basis. :)

Perhaps that statement was worded poorly. The situation referred to is often called "M$ tax." Will M$ let you install a second OS along with theirs?

Be found out the hardway about all this when they tried to license their OS to other hardware venders. (Dell and IBM probably smell blood with M$ recent problems with the DOJ).

>
> Wow. So it seems they could have done that on the 1200 too. It's like they
>tried really hard to screw that machine up.
>
Not really, the fault is with the programmer. The Atari OS used several
vectors. That way, if routines get moved (which would happen in any
revision), the programs still works. Instead of using the vectors, some
programmers hit the routines directly. If you revise the OS, then these
programs are broken.

The 1200 XL came out at a pretty high price (c. $900) so it was quite a
shock when your programs don't work anymore.

I had both the old 800 and the XL, so I had all the bases covered.

Tom Hunt has fixed the bug in SpartaDOS TDLINE.COM.
The bug gave the wrong day of the week (mon,tue,etc) after 12-31-99.
The new time/date line installer for SpartaDOS is available at:
http://www.en.com/users/russg about half way down the page.
It's the only Y2K related problem that I know of. Now it is fixed.

The new program is called CTHTDL.COM.

Huh? Details on bugs please! I picked up T3K and a pad on a lark,
figureing down the road I would pick up the 501 on clearout as a 2nd DVD
deeck. It "seems" the best feature wise, with the expanded VLM and
ability to play MP3 CDRs. What bugs???

That's what ticks me off about the "poor" way in which it was finally
rolled out. I DO have all of these things inhouse (save the eager
player, and sub a JagLink for Catboxes since Tom Harker still has mine).
Sigh.

5259. Atari 5200 memory chips

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-20 17:26:58 UTC
From: Nigel Henry <nigel.henry@virgin.net>
Message-ID: <GLbg7.12194$in6.1794496@news6-win.server.ntlworld.com>
Source record: 34531

Hi All, I recently got a 5200 (bought from the USA to the UK at great expense!). I built a composite output circuit for it so that I could use it on a monitor. When I tried it all I got was a black screen. I opened it up to investigate, and I found that one of the memory chips was missing! The chips are MK4516N-15, and are practically impossible to find (none of the usual suppliers such as BG micro, RS components, Maplin, etc. stock them).

I tried some 4116-15 chips that I do have, but it still didn't work. What is the difference between 4516 and 4116 anyway?

Getting to the point then, does anybody have, or know where I can get MK4516N-15 RAM chips?

Thanks

Nigel

To the very best of my knowledge, and I design hardware, any capacitor
connected between Vcc and Ground pins in a chip with a value of 100,
even if it is not marked with units, refers to nanofarads. "nF". No
greater cap should be used close to the chip since the charging time
constant could make the chip to turn off later and start a system
erratically. And remember the Atari was one of the best designs back
then!

Hope this helps!

Message-ID: <6f45253f.0108201135.6158def@posting.google.com>
Source record: 34536

Around 1994, I got a fever for getting an Atari. So I bought two units for $10 USDlls. I started playing around with them. At the college, I used my 65XE to test my digital designs, connecting the inputs of the circuit to the joystick ports and writing a routine to use them as outputs. Also at the college it helped me to graph some math functions so I could observe nonlinearities in sensors (I studied Electronics Engineering).

Now, I'm trying to interface to a prototype EPROM programmer, so I can burn my ROMs without investing a hundred dollars in a commercial, Windows controlled programmer. I also connected sensors to make a simple demo alarm, a green house monitor, a passage detector/counter for rats (in a lab), a robot controller and a weather station.

So, I think my Atari computers will last enough to teach my son BASIC programming, as soon as he learns to read and write. Well, that's what I'm using my Atari for. Simple, no fuss no mess computing, no MS-DOS memory barriers, no memory-hungry MS-Windows, instant boot, etc., etc.

5264. If you could design a $300 homecomputer today, what would you choose?

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-20 20:55:46 UTC
From: ajpalacios@netscape.net
Message-ID: <6f45253f.0108201255.7fed298d@posting.google.com>
Source record: 34538
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.advocacy, comp.sys.atari.st,comp.sys.cbm,comp.sys.sinclair

I really wouldn't design a $300 home computer. Way too many models of home and "productivity" (read Palm) computers out ther. Let's focus on the hobby computer. Why is the hobbist so underestimated and underpriced today?

The Ideal Hobbist computer would be an Atari-like portable computer. CPU? maybe Z80 or 6502 derivative. A low power RISC or CISC Chip, but powerful enough to avoid the flickers and glimpses in audio and video. And it must have a modest enough memory space for you to write neat apps that don't need 3 CD's to install, but cartridges or Smart Cards.

Since no HD or CD is desired, SmartCard or PCMCIA or FlashCards are desirable as storage media. Also, the back panel must have serial, parallel, and "user" ports. User port should be an Atari, CBM or Apple flavor. So every pin of the CPU and every usable signal in the system is available.

Language? If BASIC is not allowed as the main language, then it should be the rapid prototyping language option, accesible thru software commands or a small switch. But BASIC MUST be included. The main language could be Pascal, but remember that rapid prototyping means no time for detecting every single variable to declare.

Video? Well, since our system is intended to be a field-usable system, an LCD is mandatory. I don't think an SVGA resolution is needed. But a VGA is desirable, and a quarter-VGA is good enough. We want to test system parameters, sensor response, GPS tracking, missile trajectory plotting, or just fish bank detection to be instant represented with our supercharged Game Boy, right?
But remember, we are planning a Hobby Computer, so most of the graphics could be displayed in a TV. Composite Video and VGA outputs are the only two choices.

Audio? Well, it must be CD-quality. No more, no less. Remember we cannot hear beyond 20kHz, so why should I buy a computer able to emit a supersonic or subsonic sound I can't detect? Well... Maybe for Dog training or Subwoofer testing! But anyway, CD is just what we need. And complete control over the waveform thru software.

Internet? Yes! A 10/100 base T interface so I can connect my hobby computer to the local net and download any data I gathered in the field. Just like an internet "appliance". But this could be added with a PCMCIA card.

Maybe what we're trying to figure out is a new, VGA, networkable version of the Radio Shack Portable Computer sold in the early eighties, with an open, well-documented architecture. I can see it: in one hand my hobby computer with a bunch of cables attached and a piece of custom hardware sending codes to the machine. Or maybe, a credit card interface attached to an electronic cashier just like in Terminator 2. Ooops, there are some disadvantages, but just don't see 'em.

I think I'll start designing it, since a computer like that is for us, the inhabitants of the dark, underground world of electronic hobbists. A customizable, in-house expandable, easy programmable box that can be instantly attached to any project just to test or diagnose or in-system emulate. But then again, it sounds like my old Atari!

5265. Info on the Cartridge Slot Wanted!

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-20 21:13:59 UTC
From: ajpalacios@netscape.net
Message-ID: <6f45253f.0108201313.35e1e085@posting.google.com>
Source record: 34539

I'm designing an EPROM programmer that uses the Atari 65XE as the "brain". I plan to interface the programmer board thru the cartridge slot, since it has Address, data, R/W signals. But I see it also has some other signals I cannot figure out what they're used for (except RD that I discovered is Rom Detect). I need to know which memory space is addressed to the cartridge port. I found somewhere that it is allocated between $8000 and $C000, but I found it to be in a different location. Does anyone knows how to use the cartridge slot? Is there an Atari Interfacing Expert out there?

Hey all, I dusted off my old rotary phone and my acoustic coupler and tried to connect to Yogi's Jellystone BBS. I got the number off of his cracked version of Master of the lamps. I couldn't get any response, the phone answered with the carrier signal but I couldn't get anything on my screen using Telelink I. His little ad said it was 300/1200 baud, has anyone else tried it? This was the first BBS attempt I've made in about 15 years so I'm probably doing something wrong.

Whoohoo! I soldered in a new 100nF cap at C28 and this 800XL is
working perfectly now. I did the supervideo mod just for fun at the
same time.

I guess I'll have to do a burn-in test to see if it will continue
operating. Are there any test programs available (not on cart.) for
download somewhere?

The replacement routines use the same entry points. I have never had a program that ran on the existing routines that didn't run on the fast ones.

The FP routines only speed up things that use FP of course. PacMan still runs at the same speed for instance.

If you program in BASIC, you will notice about a 30% increase in speed depending on your program.
>
> 2) I have basically no information on this. Anyone?

They were only for the standard OS calls. IIRC, things like clear screen and scrolling worked much faster. Of course if you wrote your own screen scroll routines in ML, they would be an order of magnitude faster yet.

The fast FP and screen routines were quite nice for doing things like programming a telecomunication terminal in BASIC. I think you could actually get a pretty decent 1200 baud terminal out of the combination with no tricks.

Heaven. Ominmon is the best purchase I ever made for my Atari. Built in
disassembler/assembler, some disk I/O, easy entry from any envirionment. I
use it instead of MAC/65 DDT, I like it that much. Great compatibility and
built in fast FP routines too.
>
> 5) what exactly happened with these? With something like the US Doubler

Replaced the vectors in RAM with a vector pointing to their routines in RAM.

5275. FS/T: Atari 8-bit computer items and more... [08/21/2001]

Newsgroup: comp.sys.atari.8bit

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 08/15/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 2.00 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 7.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 7.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 7.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I

collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi,
I'm looking for the Atari 400/800 and Atari 5200 BIOS assembler listings
(preferably with comments and meaningful labels).
Any idea where can these files be found?

Thank you in advance,
Ronen.

5278. Re: Artical on Atari BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-21 22:11:35 UTC
From: NoOne@FakeEmail.com
Message-ID: <9104B6642CTHEnterprises@205.212.123.11>
Source record: 34553

MS BASIC for the 8-bit had something that to my knowledge none of the other versions of BASIC had- a functional COMmon keyword. Atari BASIC has it as a keyword, but it is diverted to code that makes it work like a DIM (or something similar, can't remember now...). In MS BASIC declaring a variable or constant using COM made it so that it preserved it's contents for other MS BASIC program modules to use. This functions just like it's big brothers QB and QB45. Alas, no one seemed to take advantage of this feature on the A8, where-as on the PC huge modularized applications were written using it. I think even the newest RBBS-PC 17.4 uses this still. It used to use it, but I haven't looked over the source for quite a while now.

Best,
Tom

5279. A800 Emulator Enhancement

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-21 22:56:36 UTC
From: Mark Keates <mark@mkeates.f9.co.uk>
Message-ID: <TKBg7.7850$NE.540918@wards>
Source record: 34554

I've added support for XE Super Carts (64K) on the
A800Win PLus emulator and wanted to know who to
mail the changes to? Also, I've added to the debugger
the ability to trace to a file but this uses a fixed name
and should be changed to use a file dialog.

Regards,

Mark.

Probably because it took a second or two for the CD light to light up on my coupler and by the time it did, I was disconnected.

hey Bond ...

I agree that the N-501 "seems" like the one to get, but check out the
Samsung forums on www.nuon-dome.com , where more than a few people complain
of skipping and sound sync problems with the N-501.

then again, maybe being broke after getting a $299 Cassiopeia at Best Buy
has something to do with it...

Midway Reinvents Arcade Classic With Next-Generation Remake of Defender® for the PlayStation®2 Computer Entertainment System
LOS ANGELES - May 17, 2001 (E3 Booth # 600, South Hall) - Midway Games Inc. (NYSE: MWY), a leading software industry publisher and developer, announced today that a remake of the arcade classic Defender® is in development for the PlayStation®2 computer entertainment system. Defender is scheduled to ship in 2002.

Prepare for an out-of-this-world flying experience with Defender, the ultimate action-and-strategy videogame. The Defender player's task of protecting the human race from an alien invasion has never been more challenging, as players man the controls of a powerful and impressive new Defender ship. As a Defender pilot, players must carry out a wide array of dangerous missions in an ongoing battle to protect the human race and the entire solar system from alien annihilation.

"Defender takes the classic idea of defending humans against alien attacks, and totally remakes the game to allow for a next-generation gameplay experience," said Helene Sheeler, vice president of marketing, Midway. "The new 3D version of this timeless classic will offer players an incredible mix of action and strategy, non-stop gameplay and crisp visuals."

Midway Games Inc. is a leading developer, publisher and marketer of interactive software. Midway games are available for play on all major home game platforms, including the PlayStation®2 computer entertainment system and PlayStation® game console, Nintendo® 64 and Game Boy® Color, and Sega DreamcastTM.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

I responed yesterday, but my news server puked.
There has been a atari8 chat on tue nites, 10PM EDT I think (4AM
Deutch time?, bad time.) It is at ftp.whiterose.net, join #atari8.
I don't know if it still meets.
Then there is Thur. nite chats, via browser, at stargate.cs.swau.edu/atari
http://startgate.cs.swau.edu/atari

Time is 9 Central 10pm Eastern (same time problem).
Then there is a Sunday morning chat, hoping to get Europeans at the
same URL (don't know time 10AM EDT?, about 4PM European).

Finally, you announce a time and place and maybe some people will
show up. Like irc (shoot IRC, NOT FTP above) irc.whiterose.net
join #atari8.

bill is a funny guy, he would not give me permssion to rerelease both
of his fine games, and he hinted that i did not understand what it took
to do them, and that i would not have the right equipment.
he also hinted that he wants to keep control of his product even when i
offered to pay a royalty.
so if you want it for free just download it, but if you really want the
real thing like bounty bob strikes back on a real atari computer
cartridge sorry no go.
we can reproduce them here, and i am sure everyone knows this, so if
you want a real copy of bounty bob strikes back for a real atari
computer, how about asking bill to give me permission, then i will do it
wih a neat label, and these fine games can becme availible again,
thanks,
lance

OK, got thru. And it seems there is a recent firmware patch to address
this problem! Now to read if it works...

What is more distressing is the apparent broken Logitech pad...another
reason for me to hate them, great...

I've used the firmware upgrade myself and it fixed all of the issues I had noticed. I was ready to sell the damn thing off completely before the update.

Drew

5299. Seeking recommendations for a new monitor for my Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-23 12:25:30 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0108230425.6d2687aa@posting.google.com>
Source record: 34573

Hi,

The Commodore 1084 monitor on my Atari 800 finally died last night in the middle of a game of M.U.L.E. Alas… I now must buy a new monitor.

Has anybody had any luck using large monitors (17 inch+) with their Atari 800? I would like a larger picture. But, I have found that computer monitors produce sharper pictures than a TV.

I am looking at a device called a Cheese Video Box from tvOne Media Solutions to connect my Atari 800 to a VGA monitor.

http://tvone.com/vd-300.htm

Anybody have any feedback on this solution? Anybody got any other ideas?

Getting a sharp clear picture is my primary concern. Cost, within reason, is secondary.

Thanks,
John

> depending on your program.

Wow! All the more shocking that one of these didn't end up in the 1200XL
then. I'm sure if your BASIC programs suddenly ran 30% faster that would
have gone some way to offset the problems people were having.

> They were only for the standard OS calls. IIRC, things like clear screen
and
> scrolling worked much faster. Of course if you wrote your own screen
scroll

Ahhh. So were the graphics routines in BASIC similar to the math routines,
in that they were stored in the OS ROM instead of the BASIC?

> The fast FP and screen routines were quite nice for doing things like
> programming a telecomunication terminal in BASIC. I think you could

>
> Replaced the vectors in RAM with a vector pointing to their routines in
RAM.

I'm still not terribly clear on this, but that's because I'm not totally
clear on how the OS worked with DOS. If you don't mind...

So when I did a call to talk to the disk, was that code in the OS, or was
that code loaded as a part of the DOS? IE, what does that vector point to?

Either way, what did the code in question change? Did they simply re-write some I/O routines with faster versions? Or was this code just for the disk access itself? And if it was the later, would it speed up everything when talking to the disk, or did you need hardware in the drive too?

To put it another way, was this change similar to the changes for the graphics and math routines in that it replaced existing slow code, or were they adding new code to talk to specific hardware?

I'm fairly familiar with this, at least at a first glance sort of fashion.
I still consider these routines to be a part of the OS for this thread
simply because they were physically located there.

> The DOS just installs a D: entry in HATABS and that's it.

Ok, here's where I get confused. Since the DOS was on disk, how could it
be loaded into memory for handling the disk if the disk driver code wasn't
already in the OS?

Thus the question about how the disk worked. When I called commands into
the disk (say XIO's) was the code that got called located primarily in the
OS, or loaded from the DOS. IE, exactly what did the DOS do, provide all of
the I/O for the disk (and if so, how did you boot from it?) or was it more a
collection of programs for use with the disk.

Note the problem: I never had a disk drive...

> Partially. The DOS is "just" required to add a "link" between CIO and SIO
> which are both in ROM. This link is the administrational unit that

Got it.

> Bill Wilkinson said one of the reasons they were able to fit so much

Actually as the story was told to me, they ran out of room on the cart so
he asked Atari people to put the routines into the OS ROM instead. Either
way...

> The OS routines only had some really primative routines to start a boot as
> part of its cold start procedure.

Ok, now it's all becoming clear.

> They added handshaking code to the modified disk drives<via a new ROM>. I

Got it. So this seems really really useful then, because if the problem is
in the SIO code and this OS is replacing that with the new code, then it
should be able to work with any DOS at all and still get the same benefit -
assuming you have the drive upgraded of course.

> I'm kind of a vocal advocate about how Atari drives were concieved badly.

Neat. Of course there were no IBM drives to be compatible with at the
time. Also remember that RAM was terribly expensive at the time, although
that changed by the time of the 1050.

Well, lemme clean up a little bit here: The standard floating point routines
are in the "math pack", which is not really part of the Os. It's used by
the BASIC, though. If you want to see a basic with a math pack replacement,
I'd recommend "Turbo Basic" by Frank Ossowsky (sp?). One of the major
speed improvements was due to the faster math routines that got used within
the basic - instead of calling the Os routines.

>> Replaced the vectors in RAM with a vector pointing to their routines in
> RAM.

> So when I did a call to talk to the disk, was that code in the OS, or was
> that code loaded as a part of the DOS? IE, what does that vector point to?

You'd jump into the Os, it scanned the HATABS for you - which is in RAM -
fetches the jump vectors from there and called the handler - which is also
in RAM. By a similar technique, one could replace the S: handler (for
the screen administration) by a custom S: that would do things like
plotting and line drawing faster than the Os routines - all the basic
"DRAWTO" and "PLOT" are, in fact, XIO-commands that go to a handler by
the Os CIO routine.

I wrote quite a while ago an S: handler that drew on an extra-wide 384x231
pixel screen, and by its specialized I/O routines got faster than the Os.
I might still have it somewhere...

> Either way, what did the code in question change? Did they simply re-write
> some I/O routines with faster versions? Or was this code just for the disk
> access itself? And if it was the later, would it speed up everything when
> talking to the disk, or did you need hardware in the drive too?

The DOS just installs a D: entry in HATABS and that's it. The Os uses this
vector for talking to the D: device. The matter of the D: handler is to

organize data on the disk, and to boil it down to loading and writing
entire sectors of the disk. This is, however, again an Os feature and need
not to be done within the handler. (This is the SIO routine). The main speed
brake here is neither the handler, nor the SIO, nor the disk drive, but
rather the serial communication between the main system and the drive, and
the lack of any caching logik within the drive.

Ok, let's make a drawing:

user program->CIO->HATABS->D: handler->SIO->serial port->disk drive.

Of these entries, CIO and SIO are programs within ROM, HATABS and the D:
handler are in RAM, and the serial port and the disk drive
are hardware. (-;

> To put it another way, was this change similar to the changes for the
> graphics and math routines in that it replaced existing slow code, or were
> they adding new code to talk to specific hardware?

Partially. The DOS is "just" required to add a "link" between CIO and SIO
which are both in ROM. This link is the administrational unit that
organizes raw disk sectors into files.

Hope this helps,

Thomas

Piotr Fusik has working all XE supercarts, OSS carts and SDX clones in his experimental emulator. As he is using the 'standard' dev tree, he will include this code sooner or later into Atari800 (and thus into Plus emu).

Shameless plug: his code was derived from my emulators' code and all the info is described on my carts page here: http://www2.asw.cz/~kubecj/acarts.htm. My cartridge dumping project is here: http://www2.asw.cz/~kubecj/acartdp.htm

I'm still looking for XE cart dumps of: Choplifter, Crystal Castles, Learning Phone and Mario Bros. Also protos: Midi Maze, Mean 18.

Yes, it does. So great, in fact, that I may see past my classic gaming ways and actually buy a PS2. I've been wrapped up in the Tomb Raider library this past month on a PSX a friend has lent me, and the news that Lara Croft will make an appearance on the PS2 makes that system even more attractive. Plus, reading the reviews for a new adventure game in the works, Ico, has me intrigued.

The last new gaming system I purchased was a Super NES in 1991, and I returned it to Target after completing Super Mario World, a feat I accomplished well within their 30-day return policy. Haven't bothered with newly released systems ever since.

It's same from the beginning of the computers: Small code in rom of
computer (or entered thru panel switches ;) loads few sector long boot
code which loads another few next sectors. The the dos is initialized
and uses the filesystem.

> Thus the question about how the disk worked. When I called commands into

SIO is sector, sector, sector.
CIO is file, byte, etc.

When you issue a CIO call, it goes to the D: handler which has some info
about disk structure, loads FAT etc. It the loads the corresponding
physical sector from disk thru SIO and returns the few bytes you asked
for.

> Note the problem: I never had a disk drive...

It's same in all computers/oses. Even WinNT does the same stuff ;)

Which is "better", the SuperVideo 2.1 or ClearPic mod for the 1200XL?

I have done two 800XL SV2.1 upgrades and like the result, would the
1200XL SV2.1 mod be similiar?

Thanks,

I see the periodic thread of articles here about various VGA
connectors, but no-one has definitively gone out and bought something
and come back and said "This product works great." So if you get the
Cheese Box, please review it for us!

> Getting a sharp clear picture is my primary concern. Cost,
>within reason, is secondary.

I get an excellent picture on my 800 with C= 1702 monitor, really
top-notch. But I think you are correct in wanting to get a VGA monitor
solution, because everything else is just getting very old and hard to
find.

> already in the OS?

1st, the drive is semi intelligent with a little RAM and a processor chip;
2nd the ROM OS has a routine for sending commands (write sector w/ & w/o
verify, read one, do raw disk format, & get status);
3rd the ROM OS has a boot routine to poll for a drive #1 and read sector #1
and check for some specific syntax in that data, and follow the instructions
to load and execute an application.

DOS is only one possible app (majority of others are games); it first loads
the File Management System and puts the D: device in HATABS RAM, checks for
an AUTORUN.SYS app and then for a cart. If the autorun returns control to
DOS and there is no cart, DUP.SYS loads which is your menu of disk
operations aka disk utility package. The DOS FMS is your disk houskeeper; it
organizes groups of sectors into named files, monitors which sectors are
free for use and moves data to and from RAM and the files using SIO (in ROM
OS) to read/write a block of RAM to/from a specific sector.

> Thus the question about how the disk worked. When I called commands into

a
> collection of programs for use with the disk.

XIO is just Basic's version of CIO; the code it calls for disk access is
predominately in RAM (the file management stuff) from calls to ROM CIO which
looks in RAM HATABS for the RAM DOS FMS code location which uses ROM SIO for
actual communication w/ the drive.

> Note the problem: I never had a disk drive...
>
> > Partially. The DOS is "just" required to add a "link" between CIO and
SIO

they
> did that, didn't the disk drive also have to be upgraded?

AFIK, most of the custom OSs made little alteration of CIO & SIO routines;
exceptions are the CSS one by Bob Puff and the one from the APE guy.

Oh, heck; I haven't even made the connection to the PC yet...I'm just trying to figure out how I'll (eventually) run my one good program written in Atari Pilot on my pc - I want to get it from the original 5-1/4" floppy before it dies, and transfer it into a more permanent format.
I guess I was assuming that Pilot would just be another ROM file for the PC emulator (running Atari800Win), like BASIC, or whatever.

Thanks for the input,

-Stan

> DOS is only one possible app (majority of others are games);

One thing that impressed me was the games converted
to disk from multi-load tapes. The boot sector(s) had
a short set of code to re-map the C: handler such that
a sector load would come from the next sector on the
disk. Ingeneous! It sickened me when I first saw this
as I used to map the individual tape parts to disk and
then write a modified loaded to read it in :-(Still, I
had the advantage of adding a menu to get more than
one game per disk ;-)

FamilyNet Newsgate

I have two other options to mention along with this, since the idea of
having a hard drive with my Atari 800 has always intriged me, and I found a few
solutions. :)

As mentioned below, the APE WARP and other software lets a junker PC become
a great hard drive for the Atari 800 via the SIO2PC cable.

Along with that, you can use the same cable for connecting a Atari 800 to
an Atari ST using a program called "800xldj" which a few of us in JYBOLAC use
and love.

And then there is a new option on the horizon being put together by Mr.
Atari in the Netherlands. A clever little thing called "800 MyIDE Interface"
that he is currently working on. Check it out at...

http://www.atari.myweb.nl/DrClusproject.htm

Take care and talk soon,

Doctor Clu

Right. Bill Wilkinson said one of the reasons they were able to fit so much
into an 8k BASIC was because of the all the features in the OS.
<snip>
> > > needed to use Sparta to get the speed. May I assume in UltraSpeed +
they

> So when I did a call to talk to the disk, was that code in the OS, or
was
> that code loaded as a part of the DOS? IE, what does that vector point to?

The OS routines only had some really primative routines to start a boot as
part of its cold start procedure. Typically on boot the OS initializes the
POKEY chip, Atari's combination sound, keyboard, and UART chip, polls the
serial chain for any devices attached<that grunting sound>, and loads the
first few sectors from the disk drive. The OS then transfers control to the
code snippet where it takes over the loading process.

The basic routines for all serial devices are in the OS. What the DOS does
is just use them to layout and interpret disk structure. The OS doesn't know
the directory in Atari DOS starts at sector ~360 for instance, that type
disk structure is determined by the program loaded in the boot process.

The POKEY chips function is analogous to the IBM type UARTs. It has a 16 bit divisor register that divides the system clock, 1.79 MHz, to determine the serial rate. Our serial rates are just a bit off, being derived from 1.79 MHz vs 1.84 MHz. You could theoretically get ~115k baud out of an Atari. 115k baud is a bit too fast for pratical purposes.
>
> Either way, what did the code in question change? Did they simply re-write
> some I/O routines with faster versions? Or was this code just for the disk
> access itself? And if it was the later, would it speed up everything when
> talking to the disk, or did you need hardware in the drive too?

They added handshaking code to the modified disk drives<via a new ROM>. I could be wrong on this, but I think the code tries to set the drive in high speed mode. If the drive grunts and returns an error, DOS stays in normal mode for disk I/O. If the drive acks the high speed mode, then the software reprograms POKEY's serial rate register to reflect a higher rate, i.e. 38.4k baud or 57k baud.

The interrogation and handshaking will be different for each DOS and drive. For instance, I think the Indus drives came with their own DOS and didn't support any other highspeed drives, so lower level of handshaking necessary. Sparta DOS supports several disk drive modifications so it probably does a bit more handshaking.

For that matter, you could in theory make a single density drive a HS drive by replacing only the ROM vs adding RAM.

I'm kind of a vocal advocate about how Atari drives were concieved badly. They only have 256 bytes of RAM between a RIOT chip and a 6810 RAM. What they should have done is use a 2k RAM and allow for the drives to be reprogrammed on the fly. It would have given us IBM compatibility<single sided anyway>, adaptive HS I/O, limited buffering, etcetera.

On the bright side, they were so bad it allowed after market disk drive modifications and manufacturers to flourish.
>
> To put it another way, was this change similar to the changes for the
> graphics and math routines in that it replaced existing slow code, or were

well I think you should not look for an ATR file, because it's an
image of a disk. What you need is a .bin or .xex file(as used by the
atari800win plus).

Well,
I already asked him !!! Allthough I own both game carts in their
original form, I am pretty sure, there are enough Atarians out there,
who would be interested in a re-release (not the collectors of course,
but the real-gamers). He told me, he will be thinking about it. Maybe
more Atarians should write him an e-mail about the re-release idea.
maybe he will then change his mind soon... -Andreas.

Well,
you can of course also convert Tapes to Disk and then convert the disk
to ATR image. Thats the way I do it (since I am not a hacker, I use a
C-Simulator or Howfen-DOS or something like that). -Andreas.

5337. Atari Assembler Editor versions

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-24 18:17:32 UTC
From: ejgnandt@netzero.net
Message-ID: <4d2debfd.0108241017.2465e6e2@posting.google.com>
Source record: 34460

Are there different versions of the Atari Assembler Editor cart?

Recently, bought a cart:

http://www.geocities.com/ejgnandt/EditorAssembler.jpg

Case is all brown plastic (no metal back). No spring mechanism for the edge connector and no CXL number. Seen mention of a Rev A and B somewhere, but don't know how to tell the difference.

Gene

> Anybody know where I can get a cable to convert 5-pin Atari 800
>monitor output to S-video?

Hi John, I'm doing the project you're thinking about. I bought an s-video to separate chroma/luma on RCA connectors adapter, and two RCA F-F adapters, and my atari Monitor cable with separate chroma/luma RCA-M connectors is on the way from B&C. Yes, this is the Video Cheese Box I bought. It does the composite video signal pretty well, but I'm hoping for even better results with s-video.

If this works I'll be lobbying B&C to get some of these cables made, there really should be a bit of a market for Atari 5-pin DIN to s-video cables.

I have several ATR-8000, and I have newsletters mostly on CPM that I have scanned and OCRed, and am still cleaning up. One has the copower board for msdos in it.

I would like to create an ide hard drive board, and am getting some info for generic z80, but would really like the schematics if they are avaiable.

As Russ mentioned about the chats...

I stop logging into the Tues #atari8 irc chat as is had been deserted
again for some time.

The Thurs web chat is at 8PM CST, the Sunday Eurochat is at 10AM
CST(About 6PM in the Netherlands I think).
(Make sure to click on reload after getting to the site, or choose
frameless in dark text at the top)

And there is a Tuesday night 9PM CST telnet BBS chat.

There is Maze of Agdagon using Gamelink II, others are being written.

I converted Modem battleship to Gamelink I.

I have Modem chess I was going to convert to GL I.

I think there was an adventure game that was modem, but can't remember.

The only thing I know of for the A8 was Computer Eyes, and it was single pic
only.

Problem is, too slow and not enough memory or disk space to make such a thing
really workable. Today however there are options, but no capture
hardware/software.

Microsoft's EULA only restricts how OEM's install Windows, and software "into Windows", and has no control over the rest of the product. They can't tell us not to install Linux alongside it.

> that changed by the time of the 1050.

Relative thing. By the time the 1050 came out there were a large number of disk intensive systems<CP/M> and I believe the first IBM PCs were ~1981. I replaced my circa 1977 RCA 1802 SuperElf RAM with some Intel 256X4 bits! low power CMOS devices. I am pretty sure it was only ~$10 for the two chips. I'm sure Atari could have gotten a much better deal on chips and they didn't have to use the CMOS/Intel versions which were kind of pricy.

There was also some pretty good competition, Indus/Future drives for instance came with 16k RAM and were only ~$25 more then 1050s at the time I was buying them. If Indus could do it, it is a shame Atari with its 100s of millions in sales couldn't do it.

I've read stories that the very first run of them was called Editor Assembler (instead of Assembler Editor). I don't know if there's any program difference, but I've never seen one of these until know.

Andrew Krieg has it listed as an ER on his list so it must be rare (and by Atari Inc.). There's apperently a BASIC cart like that as well. I know I'd like to get my hands on it.

> routine does, but maybe it will do something good".

Pretty sweet. I started w/ Atari assembly with some version of a
macro assembler (I still have it around somewhere). I typed the
program & assembled it. I thought it was supposed to list all the
instructions, like any self-respecting programming language, so
proceeded to modify all the lines so the assembler printed them when
compiling. Ack. Then I wondered why I didn't end up with an
executable.. but the manual didn't say.

I found asm/ed to be a lots easier way to do 8 bit assembly. But more
to the point, up until a couple years ago I <still> ended up viewing
assembly language with a some of the assumptions and ideas I developed
by accident or otherwise from the Assembler/Editor.

I owe whoever wrote that program a substantial debt.

Pay Pal and Billpoint, are available. Both charge both the sended and the receiver a fee. It is a secure transaction. Requires sign-up on both, and advantages? Can have a Credit Card customer when you don't accept them, or a check customer when you don't accept them. They will both do one of two things, they will transfer the money to your checking account, or keep it online for future use, (they will pay interest if you leave it online in their account for you!). Transfer to checking takes 2-3 days depending upon your bank, but it does show up for the reduced amount both companies tell you that your are receiving.

Hope this helps clear it up.

By now you have probably opened the drive. Look at the Rails that the Head travels on, get some alcohol and clean these up both forward and reverse of the head, Now look at the head itself. If you see clean lines from right to left its ok, if you see black specks then clean the lower with alcohol removing the black dot build up. While you are there just clean it anyway. Look now to the Pressure pad which is on the top bar. You should see a gray pad in the center, with a little bit sticking down, if not then the pad is worn out and needs replaced. You can buy felt material in any yard good store? In England Dress Makers shop? When you find the felt just cut a small circle to fit glue it in and will work. Here I use Leather Punch has right size to make new pressure pads.

Hope this helps

Tell you what, take your item to E-Bay auction, sign up list it but put
a reserve price on it and if it does not meet your reserve price you
still own it. I never thought I would like E-Bay, but it has made me
look at what I have lost in this base in the past three years. I have
sold many items here for much, much lower than the bidders on E-Bay,
including shipping and handling. What is an Indus Disk Drive in good
working order worth here? Just completed an auction on one and it went
for $71.01
plus $10.00 s/h. So do not take the first offer you receive, try
something different
and you will profit from it?

From: asdf <asdf@sdf.com>
Message-ID: <3B88BAC9.9A08D5D2@sdf.com>
Source record: 34486

```
Anyone have some fast 6502 arithmetic source?
So far I found a 38 cycles 8bit unsigned mult and a 105 cycle 8 bit
divide, is there faster, and also 16 bit versions?
Thanks
-------
8 bit unsigned divide

ldx #8
lda dividend
div cmp divisor
bcs s
sbc divisor
s rol quotient
rol
dex
bne div

timing in cycles:
overhead 5
"0" bit 20
"1" bit 18
range 148 to 164
average 156
unrolled, with dividend in A register, and last iteration optimized: 105

average of 14 cycles per bit.
dividend, quotient, and divisor are 8 bit values stored in zero page.
The remainder is left in A.
note: dividend/divisor must be < 2.

At least you had grocery money. Ok, my turn for a pointless story...

Once Christmas my mom asks me what I'd like, so I say I really want a copy of a book called The Atari Assembler. We spend Christmas at my gandparents in Timmins, and on the day I grab my mom's gift (clearly a book) and start opening it. Sound and Graphics on Your Atari. Ummm, thanks mom. After some more clearing away of gifts I see I have another book, and sure enough...

Now it's too cold in Timmins to leave the house, so I basically had a week to myself. At some point during that week my brain went "click" and I suddenly understood computers. Now keep in mind I don't actually HAVE Assembler/Editor (no money) and my machine is 450 miles away at this point. But nevertheless the combo of great writing and the wonderful 6502 made it a snap.

Never looked back.

Maury

All,
I have started a #Atari8 room on undernet. I can be found there usually
between 5:30PM Eastern Time (NJ,US) 'til about 9PM. The room is
available all the time.

16 bit versions are pretty much obvious, you just use the carry and
two memory registers instead of one.

Multiplication: If you want to multiply with a fixed factor, you can
get away with shifts and addition only, this will be pretty fast.

If you only need a subset of possible operands, you can get away with
pre-calculated look-up tables which will gain even more speed.

In some cases, you may replace a multiplication in an inner loop by
an iterated addition.

Conclusion is: It pretty much depends. A *generic* multiplication
cannot be made much faster. But depedent where exactly you need this
multiplication, you can avoid it in first place.

So long,
Thomas

I have revision A I believe. Way to long of story and pointless warning.

Back when there was a San Jose Computer I used to hang there. Normal nerd stuff, spend 4 hours looking at neat stuff you never intended to buy, then walk out with equipment purchased with this months grocery money.

SJC was one of the better ~odd stuff that must of fell off a truck or grown legs and walked out of Atari<For our readers outside the USA, these are euphenisms for items garnered by questionable means>. I think they had a combination of dumpster diver and repairman tag team. If Atari ever threw something in their dumpster, if it was repairable you would eventually see it at SJC.

So one day while perusing the shelves of parts I see a cardboard box full of what are labled as "ASM/ED Revision A $2". I bought a couple since and installed them in a old 2x4k ROM game cart. Worked! For some reason, one of the ROMs started going bad. Could have been a broken pin I soldered a piece of hook up wire to. Anyway, after about 7 tries I got a good copy of the ROM with my Thompson EBurner. I wrote a short program to combine the two files into a single file suitable for burning a 2764 ROM and commited it to silicon.

I don't know what the differences between REV A and B were, but I can't imagine it was because REV A was too fast. Compiling from memory with the sucker was like doing a 110 BAUD compile from BBS.

Even with a MAC/65 cart I still mostly used the old REV A ASM/ED. It was perfect tor teaching me some discipline vs "Add a single line of code and see if it still assembles." I got to the point where I would only compile maybe once and hour when I was ready to take a bathroom or substinance break. I stopped doing the wishful programming "I don't know what this routine does, but maybe it will do something good".

There was an article in a Kilobaud magazine circa 20 years ago on
Booth's Algorithm for multiplication. It had a source listing of
a 6502 code implementation of Booth's Algorithm, IIRC. Would you
be interested in this???

I made a couple of digitised video clips on the Atari 8-bit. One was the
"MTV News" rotating cube animation, another was a pair of Tron recognizers.
Theyp require bank-switched RAM (Atari 130XE) to run.

Making the clips:

I paused a videotape, slow-scanned the image with ComputerEyes at 160x192,
four grey levels, single-line resolution. I then stepped forward a few
frames and repeated, collecting between 25 and 32 images.

I wrote custom software to reduce each frame to 128 x 64, double-line
resolution. This shrunk the file size of each from 8KB to 2KB, enough to put
32 frames in extended memory.

Playing the clips:

I opened a Gr. mode 5 text screen, printed out the full character set twice,
then used DLIs to point each set to its half of the data for 1/2 of each
frame. Instant video!

I still have them on a disk image somewhere...if there's enough interest
I'll dig it up.

5375. Questions & Interesting Atari Facts

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-27 06:06:47 UTC
From: vinny <vinnyc@jps.net>
Message-ID: <1248B56946C80E06.E30E8DE1892D2373.755EA4DEE240E59F@lp.airnews.net>
Source record: 34400

Hello everyone,

I'm really happy to see this newsgroup around.
I used to have the original 800 (growing up in Santa Cruz) in junior high and remember mostly playing all the bootleg games (you know the ones on disk with the menu) that we use to get from some connection my friend and i had over the hill in San Jose.

Unfortunately I sold the hole lot of it a few years later when I could still get some money out of it (you know when your a kid that kind of money meant alot).

Lately I've been picking up Atari computers here and there and wanted to ask you guys your opinion.

Questions:

I basicaly want the easiest most efficient setup for bringing back all those old games I had.
My first choice is to use my newly acquired 800 but the keyboard doesn't work.
What is the difference as far as compatibility, memory of the other models? (i think i have the 600xl 800xl and 1200xl) are these as good or better than the 800? Is the xl series memory upgradeable? If so where does the memory go? How much memory do you recomend?

Also I bought and received the sio2pc cable from the guy in poland.
Do you guys think this is the best way for me to go to play all those old games?

Are there other sites aside from the links I found on the Ape web site to find more game roms? I didn't seem to find all the ones I was looking for? Are there some forbidden to be posted on an FTP?

FACTS:

My father was one of the lead mold makers that worked on the 400 and 800 casing as well as the xl cartridge mold. He told me once he was given a design for a cartridge (by atari engineers) that ended up not fitting the console! I believe Atari had to scrap the mold!

It's a shame as far as I know these molds are gone.

Another story I heard was from an associate of mine that went to the atari auction to buy furniture. He ended up buying a whole office with filing cabinets filled with original atari cartridge and manual artwork which him and his colleagues quickly threw away! What a shame!

Anyway,
I have been reading some of the messages here and was wondering. I run a plastic injection molding company (about 1 mile from the old atari building actualy) I could build a mold for a cartridge cover, I could probably copy the original exactly. I know there would be no profit in it. But maybe for a hobby if there is a real need for it. Like I heard some people talking about reproducing "Bounty Bob" for instants. What do you guys think?

You may want to see if you can find a public domain Action! run time package that includes the MAC/65 source code. I don't think I have one at the momment, but I seem to recall the one on CIS came with the .ASM or .M65 files.

not unusual. i once saw atari turf $250,000 worth of bad ROMs; they
hadn't bothered to Q/A them ("one last modification, nothing can
possibly go wrong!") and they turned out to be org'd at the wrong
start address. oops

when you lay off thousands of employees, and there is no one left at
the company who cares (or who has time to go through all the stuff
left behind), this happens :-/

when the tramiels bought the company, they sold some lab furniture,
including some cabinets that contained the masters of many cartridge
games. The surplus place in the east bay was NOT happy when the
tramiels came back for the contents.

For best compatibility with games I would recommend a 800XL or
even a 130XE. I really like the 800 but I occasionally find a use
for the extra 64k of memory in the 130XE.

The 130xe is also very easy to upgrade to 320k. Just add one
chip, some 256kx1 rams and your set. The 800XL upgrade is a little
more involved, and the 1200XL is a nightmare.

The 800XL and 1200XL upgrades are trivial if you can lay
your hands on a Rambo type board that has the upgrade already wired
and ready to plug in.

Memory upgrades are pretty hard to find for the 800.

> Also I bought and received the sio2pc cable from the guy in poland.
> Do you guys think this is the best way for me to go to play all those

If you want to actually use the computer then yes its the easiest
way. You can skip moving all the files and images to real floppies. If
you really want to get immersed and miss the smell of an overheated 1050
baking a Infocom disk inside, you might be missing something. =)

> Are there other sites aside from the links I found on the Ape web site
> to find more game roms? I didn't seem to find all the ones I was
> looking for? Are there some forbidden to be posted on an FTP?

There are a few Atari disk archives around that have all the old
commercial software. The best one is down at the moment, but if you
do a search in google you should turn something up.

If your looking for something special the people in this group
can probably help.

> FACTS:

Did the original engineering specs on the 800 case specify that it
should be able to deflect small calibur weapon fire? =) My 800 has
taken 20 years of abuse and still looks great.

> Another story I heard was from an associate of mine that went to the
> atari auction to buy furniture. He ended up buying a whole office

=(Reminds me of the story of Atari dumping tons and tons of
unsold Atari 2600 games in a hole in the desert some place, just to
be rid of them.

I would love to have some cartridge casings that were copies of
the BasicXL or SpartaDOS type cartridges. They are real easy to open,
can you can fit a pretty large PCB into them.

If you copied the SpartadosX cart, people could make thier own
pass-through carts again. Clock cartridges, etc. I'm not a big fan
of the original Atari cartridge design though.

I believe Video 61 still makes new Atari carts, conversions of
old disk games and such. You could probably liquidate a stock of
good casings pretty quick if the price was right for hobbyists.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 08/28/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 2.00 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 7.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 7.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 7.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

> Steve

True, I was thinking about that recently.
Although work on Elite has stopped whilst I
complete a paying project during the evenings,
I am looking to have both a disk version and
64K ROM version (maybe cassette too?).
I have the facilities to make the boards but
would need some casings, preferably XE Super cart.
Based on board and component costs the $19.99
U.S. price tag for a cart seems about right.
Do Video 61 have a mold or do they recycle
casings from other games? How much would a
bulk job cost, say per 100?

The disk would be freely available as an ATR but
not the ROMs which would be limited edition ;-)

Regards,

Mark

Hi,

I am looking for ideas for a challenging Atari 8-bit assembler
programming project. I would like to write something that would be
useful to a lot of 8-bit users. Is there something out there that
would genuinely be useful, but has been just too tough a nut to crack
for anyone to take the effort?
I have about a year of x86 assembler experience and 14+ years
of C/C++ experience on the PC platform. I can handle difficult
complex programming projects.
I am new to Atari 8-bit computers. As a hobby I have recently
started piecing together the Atari system I always wanted has a
teenager. I have been having a lot of fun with games, but now I want
to start exploring the Atari at a programming level.

8-)

You might consider the MyDos utilities that Andreas requested a couple of
weeks back; it's definitely big and challenging.

5390. Re: 130XE: Reset Key Not Working

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-28 23:35:06 UTC
From: Ron Hamilton <ronandjudyh@earthlink.net>
Message-ID: <KUVi7.2235$Fv3.198169@newsread2.prod.itd.earthlink.net>
Source record: 34413

Seems like we just went through this; check the archives or dejanews.com for
"Help, Broken Keyboard cable.."

Possible causes:
weak spring in keyboard assembly
grain of dust between mylars
crack in trace on mylar
abraded trace on mylar at main board connector
bad keyboard cable connector (not usually)
problem in Pokey chip (not very likely)

You sound very technically savy; have you checked the ribbon cable traces to
help isolate the trouble? Can you 'light' that indicator by (very carefully)
shorting the proper traces? Did you clean between the mylars for the
function keys? The key mechanics just squeeze the mylars to complete a
circuit on those inner traces.

If you cannot restore the contacts or correct a broken cable trace or
replace the mylars, then as a last resort, you can wire in a switch to the
pads on the bottom of the main board below the cable connector. It is just a
matter of running that reset key signal to ground to 'read' the key press.

Zap! The Rise and Fall of Atari, has been re-released and is available
directly from the publishing company at:

http://www1.xlibris.com/bookstore/bookdisplay.asp?bookid=12003

Also, I just got notice from Xlibris that they'll be raising their
prices starting Sept. 1, so if you plan on ordering this book I would
do it now.

Take care,
John

I believe they are the same, even though the Amazon listing gives the
original publishing date and doesn't have a picture of the cover.

Why do I think this? Because the ISBN on my original hardcover of ZAP! is
0-07-011543-5, which doesn't match the ISBN on the Xlibris and Amazon sites.
Also, both sites indicate the book is a paperback. IIRC, the original was
hardcover only. At least, I don't recall ever seeing it in paperback form.

Mark

BTW, I'm still kicking myself for not buying the entire stock of ZAP! when I
found it years ago on the bargain book table--marked down to $1.88!

5401. Convert Atari 8-Bit Disk Images to Actual Disks...

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-29 23:05:11 UTC
From: Mighty Echidna <cowman777@hotmail.com>
Message-ID: <3B8D74AB.D3487CBF@hotmail.com>
Source record: 34422

I'm sure you guys get this question all the time, but I can't seem to find any real discussion about it here, so here it goes...

Is there any way I can convert ATR/XFD disk images to an actual DS/DD Atari diskette for use with my Atari 130XE and 1050 Disk Drive? I have a 5&1/4" disk drive for my IBM, and no kind of formatting seems to work... (I didn't really expect it to, but I figured I'd try since I can easily transfer Atari ST images of Atari disks without any problems.) Is there some software I can get to make the computer read/write Atari diskettes, or is there some cable I can get to hook my 1050 to my IBM?

Thanks a lot
Matt

Quick and easy answer, get a 1050-2-PC or SIO2PC cable and hook your atari drive up to the serial of your PC. Use the APE software by Steven Tucker to read and write to it!

Hmmn.

I looked long and hard for a copy 5+ years ago, eventually got a copy on loan from the library.

Realize this is cross posted to several groups. As an coin-op collector (with minimal interest in home/consoles)
I found the book to be dull dull DULL. Minimal coverage of arcade, lots of pages dedicated to home/consoles.

If you're into the home Atari games, it's probably more interesting.

If your 1050 is a stock 1050, you will need disks written in a
format your PC cant produce. You will need to build or buy a serial
cable to attach your 1050 to the serial port of the PC, then transfer
disks directly to the 1050.

You can find information about APE/ProSystem at the URL below. You
can also try searching for SIO2PC on the internet, its similar software.

Agreed.

And, although it seems to be reasonably well-researched and is certainly
valuable as a treasure trove of information on Atari's home video games
division, it's very poorly written; the writing style is reminiscient of a
high school sophomore's term paper.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Orazio,

McGraw-Hill is the original publisher. The reprint is just a copy of the original text. No updates.

Glenn

Hey Stan,

I found it; zap me real addy and will send attachment. It is a binary file ORG'd at $6000 followed by some short page 6 code to relocate it to $A000 and execute it. You could make ROM code by stripping the 1st 6 bytes and taking the next 8192 as code for $A000-BFFF.

You cannot boot the Hiassoft disk on the A8; it only transfers files.

Boot the XE with a MyDos type or Sparta (>=2.3) and then insert the Hiassoft disk and copy the file(s) to wherever you like.

MyUtil uses command line switches from that option list; I found it awkward & confusing at first. The transfers were also unrelaible on my 1.2 drive, so I stick with Hiassoft.

Hey Alan;

I have searched, (unsuccessfully so far..) for such an archive; the *good*
news is that I have about 75% of their issues. Do you know approximately
when it was printed or what it was called or other salient features? Could
mail you a scan maybe.

Sorry, don't remember the animation program. I could look it up, except my copies are several hundred miles away ATM!

I have Page 6 from Issue 9 on, just missed the last few after the A5 change:-(Does anyone have the early ones? Also does anyone know what the last issue no was?

In any case I agree that it is a truly great magazine. An archive would be great, but guess Les Ellingham would have to be contacted about that. Does anyone know what he is up to since the demise of Page 6?

5420. Error 21 When Loading From Tape

Newsgroup: comp.sys.atari.8bit
Date: 2001-08-30 19:43:03 UTC
From: David Williams <Dave@darkstar64.freeserve.co.uk>
Message-ID: <3B8E974E.93892080@darkstar64.freeserve.co.uk>
Source record: 34444

Hi Folks,

Just aqquired my first 8bit Atari, a 65XE. However, I am having some trouble when trying to load games from tape. No matter what game I try and load, I keep getting and error 21. Any ideas as to how to solve this? It will happily save a program I have entered and then load it again but no luck when it comes to loading one of the tapes that came with it.
It is a standard 65XE with an XC12 tape deck

Cheers,
Dave

PS. There are over 40 games that came with it. I doubt that all of them are faulty

5421. Re: Error 21 When Loading From Tape

Source record: 34445

You probably enter CLOAD, yes ? Don't. Try to turn the console off, then hold down START and OPTION and turn it on. You'll hear the same beep. Press PLAY on the XC12 and RETURN to start loading.

If it's a basic program, it might also run without the OPTION key (which disables the built in BASIC)

Good luck.

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 8/30/2001
- Sold/Traded Items Removed

I have a limited amount of brand new (sealed) Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping. Overseas shipping is available.

Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar game system.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - (Limited Supplies)
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $10
- Spare Controller $15 (Limited Supplies)
- AC Power Supply $10 (Limited Supplies)
- RF Switch Box $5 (Limited Supplies)

** Atari Jaguar Games - New/Shrink-wrapped**
==========
Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar

game system.
- Checkered Flag $15
- CyberMorph $5 (No Box)
- Kasumi Ninja $30
- Tempest 2000 $40
- Troy Aikman Football $30
- Wolfenstein 3D $30

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Hi,

I just started working with the Atari Macro Assembler and the
Atari Program-Text Editor. I am new to Atari Assembler. Every time I
try to assemble my test source file I get an error on every line.
Obviously, I'm missing a concept somewhere 8-).

If someone could post a simple hello world source listing it
would help me a lot. I could at least know that the source code was
correct and focus on the mechanics of the assembler.

Thanks,
John

The last issue I received was #85, Autumn, 1998. I had just renewed and was
due 5 more issues/disks on my subscription, so I remember it very well.

Since I haven't seen the reprint done by Xlibris, I can't comment. The typos were supposed to be fixed, but if you say they weren't I'll check into it.

Howdy *.*!

I've found this wonderfull chipmusic site on net: www.chiptune.com,
and our most loved 8-bit atari was present with a small SAP archive.

Now the question: could *we* do a list containing all player avail on
8-bit atari (as native xl/xe binaries, not win32 software!!)?
Trackers, Players, Formats and so on... It would be great to start a
xl/xe-music FAQ - Project..

Please help me!!

bye sayz:

I don't remember what the article was called or which issue it was that had the 3D animation article in. All I remember was that the article was a cover feature and it had quite a lot of machine code in it. It had something like three modules, one which was the object creation tool which allowed you to create a wireframe sphere with a defined number of sections, one which rendered frames which allowed you to define the angle of rotation per frame in one or all of three directions, and another which displayed the animation. If you rotated an object at about 4 degrees per frame for 90 frames you could make a really smooth continuous animation. I was impressed anyway. I want to try it on an emulator on my PC.

I got rid of three great systems 14 years ago which included a 256K upgraded 800 (which I bought for £5 before upgrading), a 256K RAMBO upgraded 800XL, a 327K RAMBO upgraded 130XE, a Lazer (Happy) 1050 drive, a US Doubler 1050 drive and tons of Page 6 and other magazines. They were the days.

Sorry to disillusion you but they do charge the sender and the receiver! Want copies of my invoices from both? I can provide them. It cost the sender to send an amount and cost me on the receiver end to receive. Last payment was for $81.01 my amount received was into my account $78.36, a $2.65 charge. I know the sender paid a similar amount. Not a big deal for guaranteed money.

The only time you have a problem is when E-Bay screws up and gives your credit card number to a company that accepts them. You get a notice you have won the bid, and asked how you want to pay? You notify the company you wish BillPoint or PayPal, and E-Bay has already sent your credit card number to the company, and they have already charged you and shipped. You send your payment by BillPay or Pay Pal, they get double payment. They contact you and ask how you want the refund. I said just refund it to PayPal, well they discounted the refund to reflect the PayPal charges, should have just told them to refund it to the CC. Screwed up cost me to have them refund it and PayPal charged me to put it back into an account.

Your theory of $100 doesn't compute!

There is an upgrade to fix the problem you have, it requires a 3600 ohm resistor from pin 3 on the bottom of the keyboard slot to your selected pin, in fact it takes in the help start selection keys, from memory but don't quote me pin 23, 24 25,possibly 26. find the upgrade text and solder in the resistors and your problem will disappear.

Well,
if you remember that videos or films are merely animated pics (25 per second in PAL countries, 30 per second in NTSC countries), than of course all animated pict. shows count as videos. That way put, graphic animations, like the smurf demo, Max Headroom demo, etc. and of course all movie maker animations are some kind of video stuff. Very simple video stuff of course... (mostly described as graphic animations, not videos however). -Andreas.

So,
I would be interested in getting the ROM version, as soon as it gets
avaiable. maybe you wanna make a list of Atarians, who are willing to
buy one...
-Andreas.

Well,
use Ataridsk from hiassoft to copy files from PC to Atari or from Atari
to PC. However, Ataridsk will format a disk and copy some files, but it
will not write a DOS, thats why you merely see the strange boot screen.
Just boot up any DD DOS 2 type and then do a disk directory of the
Ataridsk disk. With your DD DOs you can now access all the files on the
Ataridsk disk (and make them bootable if you wish, i.e. write DOs or a
Gamedos onto that disk). Note: ataridsk uses sector skewing, some DOs
versions might not like that (or load/boot very slow). Besides, if you
use a HD 5,25" PC drive for formatting, you might get problems reading
the Ataridsk disk... -Andreas

What is Supercade?

I still hope that someone writes a book about the "computer era" at Atari.
There are bits and pieces, but nothing that tells the story.

Larry

Ok,
then do it - use Gr. 9 or better Gr. 9 interlaced (HIP !!) and try to
load/view (or convert) some videos, like AVI, MOV, MPEG-1, MPEG-2,
MPEG-3, MPEG-4, FLI, AIV (or AIF?), Cinepak, etc. etc. If you have any
success, come back and tell us... -Andreas.

Well,
I do not have many Page 6 /NAU mags. But it looks like I have the last
issues in A5 size (I subscribed and paid for the last six issues in -er,
1998, 1999, 2000 ??? Unfortunately, they were never released!), thus the
last issue I have is number 85 or 86 (have to take a look at home).
-Andreas.

Me and a friend had that same idea several years ago. I was thinking that you could hook the cartridge ports of several 8-bits together, and setup some sort of shared 16K RAM space. You would then have to write software for each machine that could take a job and split it up, with the results and any info that needs to be shared in the 16K of shared Ram.

I've bought several items paying with PayPal, and haven't had to pay fees. In fact
their fees page at:
http://www.paypal.com/cgi-bin/webscr?cmd=p/gen/fees-outside

States that:

-Fees for U.S. Accounts
-
-PayPal only charges Premier and Business accounts to receive payments. Fees are
-the same for receiving international payments.
-
-It is always FREE to:
-
-Open an account
-Send money
-Add funds
-Withdraw money to a bank account

>Your theory of $100 doesn't compute!

A personal account is allowed to receive up to $100 per month without any fees.

NEED PARTS!

I have two Atari 1020 plotters - found while cleaning the shead.
condition unknoiwn
no power supplies
one missing cover
1 cassett "joystick sketchpad"
3 pen sets in original package
no cables
I think I can ship these for post paid $7 cont US only

email CJ08758@yahoo.com

5473. Re: Page 6 magazine

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-01 14:06:43 UTC
From: Paul Rixon <mail@SPAMNOTprixon.co.uk>
Message-ID: <LW5k7.27097$Nb2.4393421@news2-win.server.ntlworld.com>
Source record: 34395

I remember Page 6 magazine pretty well, in fact I wrote the 8-bit games reviews from issue 29 onwards (and even got paid for them!)

I have a complete set of the mag from issue 1 to 85 and have thought about getting them on the internet, if there's enough interest then I might seriously follow this up.

For the record, the history is:

Issue 1: Dec 1982 - first issue, available by subscription only
Issue 29: Sep/Oct 1987 - first issue available via newsstand distribution
Issue 36: Feb/Mar 1989 - Page 6 buys the "Atari User" title from Database Publications. Magazine is renamed "Page 6 Atari User"
Issue 38: Jun/Jul 1989 - Magazine is renamed "New Atari User"
Issue 69: Dec 1994 - Magazine changes to A5 'booklet' format
Issue 85: Autumn 1998 - Final issue

As to the article you mentioned, I think you may be referring to the "Solid Modelling" program by Philip Robinson, which is on pages 12 to 16 of issue 26. Unfortunately my scanner isn't working right now, so maybe someone can help out?

Cheers
Paul Rixon

Hey, Paul;

Congrats on being part of a great resource! I considered "Solid Modelling" from #26, but decided he was probably referring to "3D Animation" from #30. It could be either; they both have a fair amount of machine code in data statements.

And, I want to go on record as personally having sufficient interest.

Source record: 34247

Hi Larry;

I never saw the first 3 you mention; did they redo the VTOC stuff in the ML code for DD file recovery?

DiskMend was not *really* a version since it was completely rewritten with minimal ML code to have a similar look and capabilities. It does not correct the VTOC in file recovery, just the directory entry!

My personal DiskTool started with the CIO mods from Analog #13 (cut 8 minutes of POKE to 11 seconds of binary load) and then access to 1040 sectors; someone from PSAN sent me his VTOC fix for DOS 2.5 enhanced file recovery, but it never worked (I suspect a lost bit in the mail).

I had also added a speedy ML printer screen dump, a patch to display all characters except the $9B, a G colon device screen dump, a hex number conversion, a disassembler, an option to write sectors to a new position, a sector block relocation routine and minor tweaks here & there.

My proudest moment was early on making it run from the Ready prompt without re-booting for the Autorun.sys; I had only an executable of the Basic ROM (they were $45) and no cart so initially I had just appended files.

5478. Terminal connection problem...

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-02 03:43:56 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1010902003835.2333A-100000@halifax.chebucto.ns.ca>
Source record: 34252

I'm attempting to connect via Ice-T terminal program (vt100) to my local freenet. Upon connection, I get the usual 'M\V42bis' line at the top along with 'CONNECT 14,400bps' but then nothing.

The freenet is sending out its usual login screen but I'm not receiving it. Turning echo on doesn't help. I'm so close yet so far.

I'm running Ice-T on a 130XE, 2 - XF551 drives and a US Robotics 14,400bps external modem. I had a successful connection with XE Term but the freenet requires 80 columns and XE Term only had 40 and no vt100 but the data came through from the freenet even though it was somewhat scrambled.

What am I doing wrong with Ice-T?

Thanks...

This would require careful work on address/data bus issues, long cable runs (in the several foot range) can be problematic from a induced noise standpoint. Even a run of a foot or two can allow significant EMI to be coupled in. Depending on local conditions, this could make a system unstable or unusable. Managing contention is a bit troublesome as well, quite possible degenerating into essentially a token ring system. This begins to obviate the performance gains that shared memory can offer. Not that the apporoach is automatically bad or undesirable, only that it can get complicated.

It might be easier to hook up octal uarts to form an interconnect where each machine talks to its "nearest" 8 neighbors, then implement a message passing alogorithm. Alternatively, the 8390 and variants make good small system ethernet controllers, though the software might be a little heavier.

Source record: 34255

(Using Ice-T with 14.4 modem).
Your modem is connected too fast for the Atari.
14.4 with compression yields speeds of 3 or 4 times 14.4.
Turn off compression and I'd suggest setting your modem speed to
9600.
Actually I use 4800, but some places don't allow that slow.
I use the following modem commands: Hope you can talk to your
modem.
at&q0 makes modem speed have to be same as computer speed
at%m0 turns off data compression
at&k0 turn off flow control
ats37=9 set 9600 baud or s37=8 for 4800
atn0 requires modem to use the s37 value

if you can't get an 'OK' with a 'at return' then you aren't talking to your
modem.
set translation to ASCII if for all of this, half duplex while you're
messing
with modem commands so you can see what you're typing, full duplex
once connected.

I think that's it.

5481. Help ! Lynx problem

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-02 22:43:49 UTC
From: Newsgroup <honeydripper_@hotmail.com>
Message-ID: <Xwyk7.2282$ii3.33407@news1-hme0>
Source record: 34254

Hi

I know this is not absolutely the right group, but I need some help.

I just got an Atari Lynx from a yard sale. It didn't seem to work, the power on button was a bit loose, so I took it to bits. One of the ribbon cables was slightly torn, so I repaired it using conductive paint.

At any rate, when I power up, the machine flashes briefly then switched itself off. However, I have to press the 'off' button before I can get the machine to do this again. I don't have any games to test it with, so I'm not even sure if this is actually what is supposed to happen. I think the machine should stay on, but I don't know.

Anyone got any ideas about how to repair this much underrated machine ??

Allan

Have the following Atari manuals and manual copies for sale:

400-800 HOME COMPUTER FIELD SERVICE MANUAL
ATARI PART # FD100001
VCS POP FIELD SERVICE MANUAL
ATARI PART # FD100030 (SCHMATICS MISSING)
BOTH FOR $12.00 POST PAID CONT. US ONLY

DOS XL (ZEROX COPY) MANUAL
ATARI 400/800 DISK OPERATING SYSTEM II MANUAL
ATARI PART # C016347 REV 1
SMART DOS MANUAL (ZEROX COPY)
MY DOS 3.0 USER GUIDE (ZEROX COPY)
ATARI WRITER PLUS MANUAL (ZEROX COPY)
ATARI DOS 2.5 MANUAL (PARTIAL ZEROX COPY)
ALL FOR $5.00 POST PAID CONT. US ONLY
(THIS SHOULD JUST ABOUT COVER POSTAGE)

STUDENT PILOT REFERENCE GUIDE
ATARI PART # C017811 REV 1
PICTURE THIS! PILOT TURTLE GEOMETRY
DAVID D. THORNBURG (ZEROX COPY)
BOTH FOR $5.00 POST PAID CONT. US ONLY
(THIS SHOULD JUST ABOUT COVER POSTAGE)

ATARI 850 INTERFACE MODULE OPERATOR MANUAL
ARATI PART # C015953 REV 1
ATARI MICROSOFT BASIC MANUAL
ATARI PART # CO16083-26 REV A
ATARI 400/800 BASIC REFERENCE MANUAL
ATARI PART #CO15307 REV 1
ALL FOR $12.00 POST PAID CONT. US ONLY

ATARI 850 INTERFACE MODULE OPERATOR MANUAL
ARATI PART # C015953 REV 1
ATARI 130 XE OWNERS MANUAL
ATARI PART #CO25951-001 REV A
ATARI 850 INTERFACE - NO POWER SUPPLY OR CABLES
(NOTE SINCE I FOUND THIS TUCKED AWAY OVER ONE OF THE
WORKBENCHES IN THE GARAGE IT PROBABLY IS NOT
WORKING AND SHOULD BE CONSIDERD PARTS ONLY)
ALL FOR $12.00 POST PAID CONT. US ONLY

ATARI EXPLORER JAN/FEB ISSUE 1990

I MUST HAVE SAVED THIS BECAUSE OF THE 8 BIT HACKING
YOUR ATARI ARTICLE
$3.00 POST PAID CONT. US ONLY

NOTE: NONE OF THE ABOVE CONTAIN ANY CARTS., DISKS,
OR TAPES AND ARE SOLD "AS IS". ANY THING THAT HAS
NOT BEEN SOLD WITHIN THREE WEEKS OF POSTING "WILL BE DISPOSED OF",
I NEED THE SPACE.

I CAN ONLY ACCEPT CHECK OR MONEY ORDERS.

5484. Slow TRAKing

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-03 02:34:16 UTC
From: llpwhite@cs.com
Message-ID: <20010902223416.09113.00006738@mb-mp.news.cs.com>
Source record: 34258

Here's one for all the TRAK owners out there (both of you!) :-)
I made one good TRAK AT-D2 out of two not-so-good ones, but after transplanting IC's, displays, mechs, etc., the drive still encountered far too many random read errors. TRAKs use regular IBM-type mechs, and mine both had Teac 55-A single-sided mechs. To make a long story short, I found the drive speed to be 280-282 rpm's. There is a speed adjustment pot on the bottom of the mech, and was no problem to get it set to 288. Instantly -- no read errors, not even in DD. I have never seen a drive go from so many errors to no errors from 6-8 RPM's. Incidently, this drive has the "Turbo" feature (track buffer) and the track buffer is activated by booting Dos 2.0S or Smart Dos. Some other Dos's might also open it, but in particular MyDos will not. Anyone have any info about this feature?
Larry

5485. 1050 disk drive in UK

5486. Enhanced Percom?

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-03 06:21:03 UTC
From: Ron Hamilton <ronandjudyh@earthlink.net>
Message-ID: <jjFk7.2966$IP6.314561@newsread2.prod.itd.earthlink.net>
Source record: 34260

My Percom AT88-S1 is SSSD only and its generic slave drive is SSSD or DSSD; neither will read enhanced diskettes with any (Atari, Sparta, Top, Smart, My) DOS.

The AT88-S1PD is double density capable and the slave is double sided.

Now, here is the starnge and the question. I put an unbeknownst enhanced disk in the S1PD for a directory and it read giberish like a Sparta disk. When I checked with DiskMend, I discovered it was DOS 2.5 and the Percom was getting the wrong sectors. After setting sectors per track to 26 with the SIO "O" command, it reads the correct sectors, provides a formatted directory, but generates FNMM error 164 reading the file because it thinks it is double density and the bottom half of the sector is missing to get the link and file number.

I tried the reconfigure trick with 2.0, 2.5, Top, Smart & Sparta with no results; the drive just grinds and quits with an error. The slave drive on the same controller grinds and fails to read with any DOS and either configuration.

How is the controller mistaking the density and what is the difference in the DOSes. Also, DiskMend does an SIO request for 256 bytes when it discerns a DD disk; how does it avoid an error on the 128 byte enhanced disk?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced
a line of home computers from 1979 to 1992 often referred to collectively as
the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE,
and the XE Game System.

These machines competed in the marketplace with the likes of the Commodore 64
series, the Apple II series, the Texas Instruments TI99/4A, and the Radio
Shack Color Computer. Of these, the 8-bit Atari is most similar to the
Commodore 64.

The 8-bit Atari computers are not software compatible with other Atari
platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem,
the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200,
however, do share the same joystick/controller hardware port.

Here are some of the performance specifications of the 8-bit Atari:

(Some of this text by Bill Kendrick.)

CPU: 6502 (MOS Technology)
CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors

F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. There was also a factory-authorized 48K upgrade available through dealers.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the

favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 600XL lacks separate chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal.

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (a la the XE computers) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. European 65XE's include the ECI port, present only on the 130XE in North America. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE (which was sold in western Europe). The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in

Missile Command game (hold down Select at startup), while offering 64K RAM
and full compatibility with the 65XE. It was packaged with the Light Gun,
and the Flight Simulator II and Bug Hunt cartridges.

James Bradford offers:
With the keyboard connected and no cart, basic boots, with out a
keyboard connected and no cart, the built in game runs.
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a PIA. However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missile graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital
input/output (I/O) chip. It handles such disparate tasks as the serial I/O
bus, audio generation, keyboard scan, and random number generation. It also
digitizes the resistive paddle inputs and controls maskable interrupt (IRQ)
requests from peripherals.

All four of these LSI chips function simultaneously. Careful
separation of their functions in the design phase has minimized conflicts
between the chips. The only hardware level conflict between any two
chips in the system occurs when ANTIC needs to use the address and data
buses to fetch its display information. To do this, it halts the 6502
and takes control of the buses."

6502--MORE:
While the 400/800 models contain a generic 6502B CPU (a faster version of the
original 6502A microprocessor), all of the XL/XE models contain Atari's
customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To
allow them to coexist, ANTIC must shut off the 6502, a process called
DMA. The 6502B supports DMA, but in Atari's implementation, it required 4
chips. The 6502C has an extra line called HALT. It is controlled by ANTIC
which uses it whenever it needs the data/address bus. The HALT line is on pin
35 of the Atari 6502C and must be pulled high for the chip to work.

FREDDIE:
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM
address multiplexer. According to James Bradford, "FREDDIE is a type of
memory controller. It takes the address and clock from the CPU and
multiplexes it with the appropriate timings and signals to use DYNAMIC memory.
FREDDIE also buffers the system clock crystal and divides it down then feeds
that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM.
Even if it did, you would still need the chip that does the REAL bank
switching. It is a small 16-pin chip (Atari/Best Electronics catalog number
CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from
PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS
goes to. A14 and A15 then go to FREDDIE for the address range of the extra
memory bank (or normal address range with no bank switching). The ANTIC/6502
select bits in combination with the 6502 halt line, control the switching of
the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why
people say FREDDIE does the bank switching is beyond me. An 800XL can look
like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an
extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the
800xl The small chip near FREDDIE does all the bank selection.CO25953. One line
from FREDDIE , Ras (or is it cas?) goes to this chip, Halt and the bank
/processor select lines go into this same chip and ras (cas?) comes out. a pin
for each bank. If i remember correctly, refresh also goes into this small chip.
It would be quite easy to make an 800xl work just like a 130xe with this chip
since Ras (Cas?) is required by ALL dynamic ram.

GTIA--MORE:
In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s artifacted in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

> Jindrich Kubec interjects: (5/12/01)
> This is questionable. There's at least one SECAM computer with SECAM
> GTIA part no. C020120. On the other hand it's maybe prototype. (Curt
> Vendel has it on his site).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Andreas Magenheimer writes:
All of these newer and buggy GTIA`s were built with the "eastern european" XE computers. they were made in China. Although Atari knew about this, they did not change them. so you have to replace them with older XL/XE GTIA chips...

But one more thing to GTIA and ANTIC chips: All PAL versions of these chips have a color bug, since gr. 11 produces 16 colors, but merely 15 different colors (one color: brown at the beginning and end of the palette is absolutely the same; normally there should be a red tone here !); with gr. 9 you will see 16 shades, but merely 15 different shades (the same as gr. 11, one shade is doubled!).

Strange enough, I also found this color bug to appear in PAL ANTIC chips, there is also the red tone missing (and the brown one doubled !). This color bug appears in all PAL ANTIC and especially GTIA chips. Atari never fixed it, so you find it inside any GTIA equipped PAL Atari 800 and also the later XL and XE models. Since PAL users have to live with this bug, they sometimes do programs which look absolutely strange on NTSC and vice versa (not to mention the different Herz frame 50/60 hz and higher PAL line resolution/overscan).

Imagine the following: a PAL GTIA has 15 colors in gr. 11
a NTSC GTIA has 16 colors in gr. 11
a PAL GTIA has 15 shades in gr. 9
a NTSC GTIA has 16 shades in gr. 9

Thus, a combination of gr. 9 and 11 gives:
16x16 = 256 colors on NTSC
15x15 = 225 colors on PAL

And - as said before, the bug seems also to appear with ANTIC...
Bad luck, we PAL users... Greets - Andreas Magenheimer.

Jindrich Kubec provides another opinion: (5/12/01)
"ANTIC has nothing to do with colors. So it can't have any color bug.

The colors are generated in this way: color 0 is not a color. So it leaves us with 15 colors. Imagine it as a color circle. And each color is generated with some shift. (360 / 15 degrees). It seems that the value was selected incorrectly for PAL so that the first (color 1) and last (color 15) are same or almost same.

I haven't noticed any problems with shades in graphics 9.

Thomas Richter interjects: (5/12/01)
> I did, happens on my (PAL) 800XL in Gr.9. Grey shapes 7 and 8 are
> identically. I would guess the problem is a poorly adjusted D/A converter.

Jindrich:
> I should test this. But the luminance circuits should be same for PAL &
> NTSC.

Thomas:
> Other strange effects happen if you place a shape 7 pixel near a shape 8
> pixel, it looks like a faint vertical line of a slightly darker shape.
> Most likely a capicity/charge problem in the D/A converter (note that the
> output of every single bit gets reversed!)

Jindrich:
> Yes, I notified this many times.
>
> But there is nothing like adjustable D/A converter ;) There are four
> outputs of GTIA called LUM0-LUM3. They are amplified, run thru four
> different resistors (36k, 18k, 9k1, 4k7) and the lines are then
> connected together with CSYNC. The output goes to some analog circuit
> (amplifier?) and out goes the luminance signal.

Thomas:
> This *IS* the D/A converter. (-;

Jindrich:
> But it's not adjustable ;)

Greg Menke:
> Sure it is, just change the resistors- 10 turn pots with the center
> values more or less equivalent to the respective resistors would
> probably do it.

Jindrich Kubec adds:
"The other thing is real existing GTIA problem in latest revisions of China produced XEs, where GTIA modes have problem that 2 of 4 subpixels of pixel have invalid luminance."

Technical data and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's

Atari Interactive Divisions release of this data. See:
http://www.atari-history.com/articles.html

Subject: 1.12) What is the internal layout of the 8-bit Atari?

Subject: 2.1) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Standard Television:
You'll need an RF (radio frequency--video and audio signals in the same line) video cable (not detachable on the 400/800), and a TV Switch Box which allows connection either to the VHF input or to the cable input on the TV. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

Brent Buescher, Jr. writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

Bryan Edewaard writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Subject: 2.2) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is

525 lines/screen with a 60 times a second refresh - again only half
the lines each refresh so a 30 times a second frame rate. This
would change the amount of time available during vertical sync pulse,
and the number of lines that need to be redrawn each time.

Graham Thornton adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate
to 50Hz which allows most of the PAL-only European software to run. Your
system will still report itself as a NTSC machine, unless you change the
ROM (see the Nir Dary upgrade), but most software doesn't care.

But James Bradford responds: (7/19/00)
Not true. the PAL Flag is in the GTIA chip, not in ROM. The NTSC and
PAL roms are the same. Only Rev A ROM was had different versions. I am
not sure if Rev B ROMs had seperate versions.

Graham continues:
The one problem you might run into is your monitor. Replacing the ANTIC
will mean your North-American Atari is now generating an NTSC signal at
50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs
and monitors don't care but that isn't actually true. My brand-new Sony
Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but
my 15-year old 10" Texas Instruments color monitor (designed for the
TI-99/4A) is fine.

You can also use real European equipment here in North America, provided
that you have a PAL-compatible TV/monitor. The frequency of the power
system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 2.3) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

(some PAL demos flicker, or won't run at all on NTSC machines)

Brent Buescher, Jr. writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

Thomas Richter adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat

function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the ANTIC-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the XL computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 2.4) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

http://www.ee.washington.edu/conselec/CE/kuhn/ntsc/95x4.htm
http://www.alkenmrs.com/video/standards.html
http://www.ee.surrey.ac.uk/Contrib/WorldTV/
http://www3.3dresearch.com/video/Countries2.html
http://www3.3dresearch.com/video/Conversion2.html

Subject: 3.1) What are the Atari 410, 1010, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- permanent SIO cable - must end SIO daisy chain
- power - plugs directly into wall

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
XC12 Program Recorder
XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland

image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

---

Subject: 3.2) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.3) What are the Atari 810, 1050, and XF551 Disk Drives?

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. Single-Sided, Single-Density:

FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS I (very early) or DOS II Version 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability:
Single-Sided, Single-Density, 810 compatible
Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because it
is not true double-density:
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS II v2.0S, DOS III, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050:
ICD US Doubler SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
Happy Backup. also read/write 180K 5.25" MS-DOS floppies
CSS Super Archiver SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
CSS Super Archiver II SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone)
Super Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone),w/180K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive
Single-Sided, Single-Density, 810 compatible
Single-Sided, Enhanced-Density, 1050 compatible
Single-Sided, Double-Density:
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, rendering it incompatible with existing third-party 180K formats on the reverse side of the disk.
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM.
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm

Subject: 3.4) What floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar, James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas Magenheimer

SS=Single-Sided SD=Single-Density, 90K/disk side

Subject: 3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round

problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.6) What do I need to connect a hard drive to my 8-bit Atari?

==> Corvus hard drive (10 megabytes)
Fast but still relatively slow I/O, kludge through joystick ports for 800 only

==> K-Products/Supra Hard Disk Drive Interface
by K-Products (Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer:
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)

- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

Atari 1020 Color Printer:
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included
Frank McKenney writes: The printer/plotter mechanism for the Atari 1020 is (I believe) the same one used in the Tandy/Radio Shack CGP series and the Commodore 1520(?), and was made by a company named ALPS.

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mann-Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe only

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

Atari XMM801 Printer:
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received via standard telephone lines.

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- direct-connect
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are

known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32
14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications
software to enable hardware flow control. If your terminal interface
allows you to set the terminal<->modem (DTE) and modem<->modem (DCE)
baud rates separately, you should set the DTE rate to the maximum
allowed. If the DTE and DCE cannot be set separately, set the terminal
baud rate at four times the maximum actual data rate of your modem
(V.42bis achieves a compression ratio of up to 4:1). Examples: If a
V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a
V.32/V.42bis modem is used, set the terminal for 38400 baud. If a
V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression.
(Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari
RS232 interfaces do not support hardware flow control. (I have heard
that the P:R: Connection does too, but it can't be controlled in
software.) So we must send the modem a command to tell the modem not to
use it. Using a Hayes-compatible modem, the modem command AT &K4 will
enable software flow control, and disable hardware flow control. AT &K0
will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it
set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the
highest speed, using LAP/M, and compression. Even if you connect modem to
modem at 14.4k, you can be talking to the modem at 300 baud, and it will still
use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its just an added step that the data goes through. Note that if the modem's input buffer is small, you can overrun it easily if you send it data faster than it can digest and send. That's why you -really should- be using flow control with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have software flow control enabled? (flow control characters could appear in data stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and Ymodem don't. Also, you are able to digest the data as fast as the modem is giving it to you, hence no flow control is happening. I suspect it would be a different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I
>need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm
>running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a
>few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most atari serial interfaces or at least R: handler software does not support hardware (CTS/RTS) handshaking (selected on the modem via &K3 which is also a default). Anyway, that's why the &K4 setting helps a lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their
native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to
: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it
needs to. The faster modem will wait for I/O without any complaints.
Disabling compression isn't a good idea because it will disable it for ALL
calls including 9600 or 14.4 users in which it could do some good even on
an 8-bit BBS. Software flow control is pretty much dead in
telecommunication, and has been dead as long as data compression has been
standard since the stop and start commands take way too long to register
that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their
modem via reconfiguration. And if users have to do this, odds are they
will stay away rather than futz with AT settings to get a reliable
connect. That's why I think the MIO essentially died as a viable BBS
interface when 14.4s became standard. They won't work well unless the
"mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF
flow control, which is a form of software flow control. As I understand
it, when a XOFF is sent by the receiving end of a line, the sending
end holds off sending for a little while to give the receiving end
a chance to catch up. When the receiving end catches up, it can
send a XON which tells the sending end to continue sending. Using this
should reduce the liklihood of dropped characters. It's not as good as
hardware (RTS/CTS -- check out the FC light on most high-speed external
modems on fast transfers) flow control (enabled by default or the
at&k3 command), but it's good enough for the Atari, which as I
understand, doesn't normally allow hardware flow control, unless using
such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster,
don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O
and BlackBox, use it for all it's worth. If you are on an 850 or
P:R:Connection, you won't be able to deal with it and probably won't be
going at or above 9600bps anyway.

Subject: 6.1) What is the Atari 850 Interface Module?

Atari 850 Interface Module:
- early design all metal (black) case
- most in plastic beige case
- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

850 R1: Serial port DB9P:

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file,
which is the XEP80 handler. If you want to use the module with an application
that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you
can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit
numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2 joysticks)

CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

For definitive information on unreleased Atari products, see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive controller&FREDDIE
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D. some were produced!
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer

XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.

'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:

http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~
james adds (3/8/01):
Your faq, regarding OS Rev A, states:
Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.

Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.

Subject: 7.2) What versions of Atari BASIC are there?

There were three versions of Atari BASIC produced: A, B, and C.

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga adds:
You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

On versions A, B, and C, Greg Miller writes:

"Rev A had a number of bugs, not just the commonly
described crash bug. Rev B fixed most (maybe all, I don't remember) of
these, but in the process, they added a new bug. You see, the crashes
were caused by a bug in one of OSS's memory move routines. When the bug
was fixed, the fix mistakenly applied to a routine that actually worked
in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by
Compute! books. Bill Wilkinson described many of the problems in detail.
He also talked about it in his column in Compute! magazine."

Wally Lang adds:

--- Warner's Atari issued Rev B in two formats:
(1) As a built-in Basic on 600XL and 800XL computers.
(2) As a special request order item for 400/800 and 1200XL computers.

--- Tramiel's Atari issued Rev C in both formats for XE series computers and
ALL previous Atari 8-Bit Computers.

Subject: 7.3) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.
~~~~~~~~~~~~~~~~~~~~

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It consists of a single file, DOS.SYS, which is loaded into memory from disk on startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS I. The DOS I disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. This is the double density version of DOS 2.0S.
The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS III shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS III uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS III, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS III was not widely accepted by the Atari community, and like DOS I is not generally used except for curiosity's sake.

DOS 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS III disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS III, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS III, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of

most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS I and DOS III before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.4) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available. MyDOS 4.53/3 was released by David R. Eichel on 12/31/89.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
(it is pronounced "Bay Vay Dos")

Carolyn Hoglin adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed

to do that on drive 1.) Also supported are large ramdisks for Axlon,
Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an
excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??
- SuperDOS 5.1
- BiboDOS 5.x

Subject: 7.5) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.6) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer (5/12/01), Mathy van Nisselroy (5/12/01)

- Diamond GOS version 1 (PD disk version), version 2 (cart), version 3 (cart);
plus some applications (painter program, text program, etc.); Diamond GOS has
been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different
versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems
(this one merely works under Sparta DOS, not with Bewe-DOS and not at all with
DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some
applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as
SAM, the software aided mouth) from PPP/Germany. It is avaiable in two
different versions: a) the type-in listing from Atari magazin and/or the Lazy
finger disks (which are PD!) or b) the commercial version 2.0 which has many
add-ons and can still be bought from Dean Garaghty/UK or
PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and
Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-Basic; freeware;
http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-Basic;freeware,
http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-Basic; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the basic file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small basic program, that looks like a GUI; it can merely load Basic files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- Basic desktop, a GUI written in Basic just as a sample, what can be done with an 8-bit computer; this one loads basic and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and basic files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt, it's being Beta tested

- there are a lot more GUI programs, however many of them are written in Basic or Turbo Basic and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 8.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No

Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 8.2) What BBS software can be used on the Atari?

This section mostly by Winston Smith.
Credit for AMIS to MACE by Steven Sturza.

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"

rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 8.3) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/atari.htm

Revision : 1.3
Date.... : 4/19/1999

```
============================================================
!!!! This section is under construction - HELP WANTED !!!!
------------------------------------------------------------
The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
============================================================

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package....... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
```

features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include

Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs

features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga

available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler, menu shell, manual
features...... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package....... : BASIC compiler
features...... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package....... : BASIC compiler
features...... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package....... : ?
features...... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package....... : BASIC interpreter, manual
features...... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler (V1.1)
features...... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package....... : ?
features...... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : www.cc65.org

package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to

compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
package....... : ?
features...... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package....... : ?
features...... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package....... : editor, compiler, linker, macro-assembler
and manual
features...... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package....... : ?
features...... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX

available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 8.4) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)

Subject: 8.5) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz controllers description), Andreas Magenheimer

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor, Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad controllers linked together with RJ-11 jacks (standard phone jacks) to a box with 2 joystick port connectors.

Party Quiz by Suncom

Andreas Magenheimer contributes the following:
- Networking 1-8 players/computers games:
Dataque once (1989-1992) developed a Network game+cable which lets you connect 1-8 A8 computers together. The cable (octagon or so) could be selfmade or bought. The game avaiable was Maze of Agdagon (shareware from the Agda Group/Dataque). Maze of Agdagon worked on all 8Bit Ataris with a minimum of 48k RAM. In 1999/2000 Bewesoft discovered this and developed the game Multidash which is network-compatible to the previous game, i.e. it can use the same network cable. But, because of its interlaced grapic mode Multidash will only run on XL/XE computers. Therfore Jiri included a good Gr. 8 picture how to built an easy network cable for 2 players/computers (using a SIO cable as a nullmodem cable!) and an -not so easy - network cable for 2-8 players/computers. The game and its text+picture was released as freeware; it can be found on the internet or the abbuc magazine...

in short: networking games with 1-8 players: a) Maze of Agdagon
b) Multidash

- more multi-joystick games:
MULTIJOY device by Radek Sterba (Raster), supports 8 joysticks attached to one controller port.
Two games by Raster supporting this device: Cervi, Multris.
http://www.infos.cz/raster/atari

Subject: 8.6) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase First Star Software / Parker
Atlantis Imagic
Attack at EP-CYG-4 (by Bram) Romox

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 8.7) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
all Lightgun games can be used with a lightpen (which is not as accurate as a Lightgun however). And: all lightpen games can be used with lightgun. thus add:
- Atari Graphics (Atari) Lightpen graphic software
- 5 Matrix or Matrix 5, a PD game...
- Alien Invaders (DGS) a Space Invaders clone from the brits...
- Bembelwo (Thorsten Butschke) a sort of golf/minesweeper game, written in Quick and PD!
- Sharp Shooter (Mat*Rat) a PD game from Analog, also avaiable on cart from Video 61/Lance Ringquist
- Lightgun Shooter (ABBUC mag.) a simple shooter game, at least PD!
- Flyshot (or Flyshoot) a Turbo Basic game (PD) from ZONG, the KE Soft mag.

More:
Geisterschloss by KE Soft, 1992

Subject: 8.8) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
-------------- ----------------------
Missile Command (Atari) CTRL-T
Slime (Synapse) [T]
Shanghai (Activision) choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
Bombdown (Roemer of Uno) choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
Minesweeper (PPP/PD-World Versand) use an ST mouse in port 2

The Brundles (KE-Soft/Kaisersoft) use an ST mouse in port 2
The Brundles Editor (KE-Soft, PD) use an ST mouse in port 2
Geisterschloss/Ghost Castle (KE-Soft, PD) choose Lightgun (port 1) or ST
mouse (port 2)
10-12 games from ZONG magazine ST mouse games !! (they use port 2
(KE SOFT, now PD) and a driver
called KEMAUS.COM)
Multi-Mouse manager (PD/shareware) drivers for mice, TB, etc.
Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
little Calculator (AMC-Verlag, PD) uses mouse only (port 2)
big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
M.O.S. (ABBUC magazine) uses an ST mouse in port 2
Multi-(Tasking-)Operating-System,
Diamond GOS (Reeve software) Version 1.0 (disk), 2.0 & 3.0
(cart.)
support an ST mouse in port 2
S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
G.O.E. (TCS) supports an ST mouse in port 1
BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions avaible... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC avaiable. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, germany).
maybe somebody already did this with Harvey`s TB (and to make things
worse: the old Atari 800 version does not support a mouse; so if the TB
has been converted to a mouse this MC version will not work with it!).

Subject: 8.9) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- many more dozens of Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

Subject: 8.10) What programs have a CX85 mode?

Andreas Magenheimer writes:

- Multi mouse Management (PD)
- UPN calculator (PD)
- the Bookkeeper (published by ???)
- Bombdown (Roemer of Uno)
- many games from KE-Soft and Powersoft
(forgot their names, help needed!)

Subject 8.11) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- many more (which I do not remember right now!)

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: superarc.arc - both Super Un-Arc & Super Arc
suprarc2.arc - Super Arc
supunarc.com - Super Un-Arc
supunarc.uue - Super Un-Arc
location: http://www.umich.edu/~archive/atari/8bit/Archivers/Arc/

Subject: 9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Image format invented by Bob Puff, for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer platforms.

XFD - Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.

PRO - Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

SCP - SpartaDOS SCOPY image file.

DI - Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

One tool for converting among all of these disk image formats is:
Acvt v1.06 by Jindrich Kubec

Latest version can be found at http://www.asw.cz/~kubecj

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated

copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a

cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

Ernest R. Schreurs writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this

underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Ataridsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

MyUTIL and the XF551 - tips from JTKIRK:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to Preston Crow:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a
carrier detect. Notably, 'Express 850' does not. I have
only used 'Procomm 2.4.3' (the last shareware version of
Procomm) on the PC and Bob Term on the Atari, but other
term programs may work.

To check your null modem connection, start both PC and
Atari term programs, set baud to 2400 or 4800 on both
computers. No parity, 8 data bits, 1 stop bit on the PC.
Be sure to use the correct COM port on the PC. Go to
'terminal' mode and you should now be able to type on
either computer and see it on the other screen. To
accomplish a file transfer, use Y-modem probably from
Bob Term, rather than X-modem. X-modem will often append
bytes to a file transfer, an undesirable event. There is
also a very nice Z-modem recieve program for the Atari,
called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3

4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.4) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 11.5) What is the Atari Peripheral Emulator (APE)?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software. The Atari Peripheral Emulator (APE for short) lets your PC act as high-speed drives. It lets you print to your PC printer. And it lets you use your PC modem on the 8-bit."

The APE ProSystem goes even further. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a device designed to allow direct connection of a stock 1050 disk drive directly to a PC for use by the PROSYS.EXE software.

APE home page: http://www.atarimax.com/

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 15.1) How did Atari get it's name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 15.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

ATARI BASIC: (according to Atari BASIC Sourcebook)
Paul Laughton and Kathleen O'Brien - Most of Atari Basic
Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979.

These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

This extremely long URL leads to Atari's patent for the 8-bit Atari computer: (thanks Rick Cortese)
http://164.195.100.11/netacgi/nph-Parser?Sect1=PTO2&Sect2=HITOFF&p=2&u=/netahtml/search-bool.html&r=94&f=G&l=50&co1=AND&d=pall&s1=atari.ASNM.&OS=AN/atari&RS=AN/atari

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-operated games under the Atari Games brand.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market only.

Atari Games was acquired by Midway Games on March 29, 1996.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand. The last coin-op game with the Atari Games logo: San Francisco Rush 2049, released in 1999.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro's games, including several re-makes of classic Atari titles, were marketed under the Atari label. The Atari Interactive brand was termed "a Hasbro Affiliate."

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro. The purchase included the Atari titles and intellectual properties.

TODAY
Atari is a label of Infogrames Entertainment.

Founded in 1983, France-based Infogrames Entertainment SA (IESA) is a global publisher and distributor of video games for consoles (Sony, Sega, Nintendo, and Microsoft), personal computers and Macintosh systems, as well as interactive digital television, mobile smart devices (WAP, HDML) and in-flight entertainment systems. The company's award-winning franchises include Alone In The Dark, Driver, Deer Hunter, Test Drive, and Unreal. Infogrames Inc.'s Humongous Entertainment division is a leader in children's entertainment software and its Macintosh publishing label, MacSoft, is the number one publisher of Macintosh entertainment software. IESA recently acquired

Infogrames Interactive, Inc. (formerly Hasbro Interactive), including its line
of software based on well-known licenses such as Monopoly, Jeopardy, Tonka,
and Atari.

Corporate web home: http://www.infogrames.com/

The Atari website: http://www.atari.com/

Atari currently (9/00) markets:
Atari Arcade Hits 1 & 2
Breakout
Centipede
Frogger
Glover
H.E.D.Z. - Head Extreme Destruction Zone
Missile Command
Nerf ArenaBlast
Pong
Q*Bert
The Next Tetris

Infrogrames' first Atari release: Atari Anniversary Edition (7/01)

I think it would be really useful to make a library of useful routines, like disk i/o, setup graphics mode, plot, return model #, cpu speed, fetch ram pages (including several K amounts of continuous memory), extended and expanded memory accessed (that is, dma based and i/o page based), sound access, keyboard read, joystick read, and zero page location request (again, request several zp in a row).
the reason I say this is cross model and platform compatibility, which can lead to a C standard library for the cc65.org compiler so that you can make a nice project and all 8bitters can use it. There are so few 6502 programmers left that we have to gather the strengths of all 8 bit platforms to proceed as a community.
Just my idea.
I can tell you for sure we would need:
fetchkeyraw - return raw keycode for this machine (atari ascii or whatever)
raw2ascii - convert (as closely as possible) atari ascii to standard ascii

raw2xtra - convert atascii to some kind of standardized extra keys, like F keys which commodore/atari have, cursor keys, etc.
getpage - reserve 256 bytes of memory anywhere and return pointer like $60 means $6000-$60ff
getpages - get N pages continuous (for those who need 1k tables etc.)
getfar - read ram under rom, or ram expansions etc
storefar
howmanyjoy - return # joysticks
readjoyN - read a joystick
readpaddleN - read paddle
writefile - open a standard temp file - call it anything - and close it
readfile - read the file back (can be used as bare minimum to save prefs, highscores etc.)
should save an area of memory, save as 8bit bytes
cpuspeed - return cpu speed in cycles/sec
settimer - start a cycle timer if possible
stoptimer
settimeraddress - where the interrupt starts exectuing
getzp

This is nothing fancy but I know from experience that the bare minimum of routines to make any decent program is access to memory #1, access to timers and input/output, then files, then sound (sound is probalby not essential for most things).
Text modes can be almost exactly the same on good enough platforms - comoodore/atari can have 40x25 text screen, and 80 column text screen can be simulated with this (or real 80 column for commodre 128).
Bare minimum graphics are also compatible, saw black plotting on white in 320x200, this is enough for graphs and so on, but I don't expect this to be amultiplatform gaming thing - though even games can make use of standard joystick/paddle/keyboard/ram access.

I' m not familiar with 1050-2-PC. I take it is a cable to allow transfer
from PC to 1050. Your 3.2f must be a .dcm or .atr, it can't just
be the files. Any boot disk has to have the boot sectors written.
I don't know where I can find some info on 1050-2-PC.

5492. New to SpartaDOS.....

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-03 22:38:48 UTC
From: Nigel Henry <nigel.henry@virgin.net>
Message-ID: <hETk7.37979$wX5.4795794@news6-win.server.ntlworld.com>
Source record: 34265

Hi again all. I recently got a 1050 with a US doubler fitted, but without any software or manuals. Now, I never had a US doubler in the "good old days", so I was anxious to see what it could do when I finally got one. Anyway, I downloaded SpartsDOS 3.2f from one of the ftp's and transfered it to floppy with 1050-2-PC. But the produced disk doesn't work- when I boot up it reads the first few sectors and then just stops. Am I doing somthing wrong? Is there somthing special I'm supposed to do to run SpartaDOS, or is it not possible to copy this program? The drive seems to function OK otherwise.

Thanks for the help

Nigel

You may have formatted the disk incorrectly, or used a non-working
image. Did you download the disk image by FTP? Make sure you used the
binary transfer mode.

If all else fails just e-mail me your address and I will post you
a working 3.2f and DOS 2.5 diskette.

Here's something I wrote eight years ago. I wrote a slightly larger,
faster version, but I have misplaced that source code. Though if
anyone is actually interested in this kind of stuff and requests
it, I might manage to recreate the source for the faster version.

(BTW the reason for the TSR flag is to prevent SpartaDos from
installing the program twice.)

That makes sence.

>Also, on a single density double sided (1440 sectors) disk, there
>are no file numbers. You would need 2 algorithms smart enough to detect the
>mode and utilize the correct proceduress.

That doesn't make sence. The single density double sided that is. IIRC the
XF551 won't even support that.

Howdy Andreas, folks

> But I do not know, how MyDOS has to be patched to do so...

Since this would be a .COM file you load from DOS, you can 'by pass' MyDOS if
you need to and have the file do what MyDOS can't handle by itself.

If there is room left, maybe you guys could stuff in some kind of copy utility.

CU Mathy van Nisselroy

Hi,

Thanks, for taking the time to respond to my posting. I really
like your idea of a 6502 assembler library. That will let me start
with simple objectives and build from there. I have to admit; I have
found the Atari 6502 platform a little more difficult to pick up than
I had first thought. There are some incredibly powerful assembly
tools for the Intel x86 platform that just do not exist on the 6502
platform. However, I have had a few small successes.
I can tell I am farther from tackling a big project than I
thought. But, I am undeterred. There is a certain technical
aesthetic artistic and historic quality to these machines that I
really enjoy.
Anyway, I think the idea of starting small and building a
foundation library is a good idea. That is how I plan to proceed at
this point.

Thanks,
John

: No comment. :-)

:-))
b.t.w. I started with a similar project a while ago in machinecode. The whole
CD-player (drawing in ATASCII) is done. Only the CD-play routines have to be
inserted.

But I had to unpack my Atari 8-bit again since I forgot to copy ATOS from my
PC to my BlackBox harddisk, and I need it to show it to Jiri Bernasek, since
Tom Hunt has some question about it...
Right now it's busy RCOPYing the whole ATR from a networkdrive to my Atari
harddisk. That is, file-by-file, so it could take a while :-) When it's done
I'll try to find the LCD-font. Now I just hope it is on that harddisk,...

1050-2-PC is a device similar to SIO2PC, also developed by Nick Kennedy,
which allows the connection of a 1050 drive to your PC. Using SIO2PC
software, you can then write ATR disk images to real atari disks. You can
also create ATR disk images from atari 5.25" disks. It's really cool.

Glad you like it - but, there are some powerful 6502 assemblers, one's even called MASM :) I heard one called ACE by a commodore guy is good, of course you can use it for any 6502. There's an assembler that comes with the C compiler at www.cc65.org as well. All the usual like macros, conditional assembly etc. are available. You should realize also that you can actually count cycles on a 6502 without worrying about cache hits :)
All legal instructions are 2-7 cycles, but most are 2-5. Be aware that accesses to the lower 256 bytes of ram are one cycle faster, and also that's the only place you can store pointers for indirect addressing modes.
Usually it's faster to use absolute mode, to clear ram use sta $1000,y:iny:bne loop
instead of lda #$10:sta $03:ldy #0:sty $02:sta ($03),y:iny:bne loop
or even sta $1000,y:sta $1080,y:iny:bpl loop
If you have any questions about learning 6502 plz post.
good luck
ps if you start writing and then post your code, I can help you optimize it then you can learn some tricks from our land.

Steve, I ftp'd from http://www.umich.edu/~archive/atari/8bit/ and got the image in DCM format. I then converted to ATR using Imagic (Thanks!) and it reported no errors. I then used 1050-2-PC to make a real atari disk. But when I boot up, it reads a few sectors and stops. Looking at the created disk with MyDOS shows no files and no free sectors. You are supposed to boot sparta like any other disk, arn't you?

Ok, Nigel.
Like Steve says, maybe the format wasn't correct.
Could be a busted image, that's why .zips or .arc are preferable,
zip or arc reports a busted file.
You might wanna try one of the images at ftp:://ftp.spudster.org
in the utilities/atr/fte directory, I think you'll find fted32g.atr.
Better would be utilities/dcm/dos/spartado/fted32g.arc file.

I have a large selection of classic computer and video game hardware, software and accessories for sale, many from private collections. Many of the items and game titles (for Intellivision, Colecovision and Atari) are still available in shrink-wrapped/brand new form, ideal for anyone just starting a classic computer or videogame collection.

Currently I have items for the following models/systems...please email me with the categories you are interested in, to receive a detailed listing.

- Atari 8bit Computers
- Atari ST Computers
- TI 99/4A
- Commodore 64
- Commodore Vic 20
- Commodore Amiga
- Mattel Intellivision (over 50 sealed titles available)
- ColecoVision (over a dozen sealed titles available)
- Atari 2600
- Atari 5200
- Atari 7800 (over a dozen sealed titles available)
- Atari Jaguar
- Mattel Handheld Games
- Coleco Handheld Games

If you are interested in any of these items, please respond by emailing me at jim_l@NO.SPAM.telusplanet.net?subject=Classics (removing the 'NO.SPAM'. first). I am located in Edmonton, Alberta, Canada, but ship worldwide, dealer inquiries are welcomed. I am also willing to accept trades of certain classic computer, video games, and handheld items, please contact me for our want list.

Disable hardware flow control on the modem. You may be able to do
this by issuing the AT&K0 (thats a zero at the end) command. If you see
what your typing thats ok, you should see 'OK' after you type the
command and press enter though.

Make sure your terminal emulator is set to ASCII mode when you
issue the command.

What ATASCII functions do you lose using this? As I recall
the Hyper E: handler dropped some functions like insert/delete
to achieve its speed.

E-mail me the SpartaDos ATR image and I will verify that its OK
for you before you go any further with the hardware.

Even if the disk was written out correctly, you would not be able
to list the directory with MyDOS since SpartaDOS stores its file
directory in a different format and at a different disk location.

If the disk is written out correctly you should be able to
boot it. If just the first 10 or 20 sectors were written out correctly
you would see a SpartaDOS error message.

I'll check your ATR image and we can proceed from there with some
confidence.

5519. ATARI - 8 BIT AND ST SOFTWARE / HARDWARE FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-05 01:11:59 UTC
From: jclmaster@hotmail.com
Message-ID: <b3917ecc.0109041711.79f0ee0d@posting.google.com>
Source record: 34293
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

If anyone is looking for ATARI 8-bit or ST software / hardware, please take a look at my site as noted below. Please feel free to make an offer if you feel the price is too high (or heck! If its too low feel free to offer more!) SMILE! These are items that I used personally. I would especially be more likely to deal on volume purchases!

I have 3 INDUS GT PLASTIC DISK CASES that have a lot of 5 1/4 diskettes that would need to be erased before they could be used for scratch. MAke me an offer for these as they are not listed on the WEB SITE!

Hi All,

I have a listing on eBay for a working ICD 256K MIO, just click the
link below to view the listing!

This item was in use up until recently, but I have more than one so
decided to make some room in my computer area.

Item is gauranteed not to be DOA and in working order.

Thanks,
Brian

Well the obvious problem is cabling- the comm. uses a DIN and the Atari uses
the SIO squareish plug.

Ya know... this may not be as hard as it seems. The only part that I can't even
begin to grasp would be the actual physical connection. Possible ?? dunno...

I used to do a lot of "cracking" copy protections off of C64/1541 software and
have a little understanding of the way the 1541 works.

The 1541(II) has it's own cpu/rom and unlike the ATARI systems all you really
do with a C= drive is send a command string. To format a disk, for example...

open15,8,15,"n0:[diskname],[id]"
close15

Where 15 is the command channel.. 8 is the drive # (like d1:) and the next 15
is a secondary address (arbitrary). n0: tells the drive you want to format (or
"new") the device "0" (some C= drive units contained two physical drives). You
supply up to a 16 character string name and a two alpha-numeric id and the
drive takes over the formatting. If you don't close the channel immediately,
the computer will be free for other use. The DOS format routines are completely
self-contained in the 1541 rom !!! (similar for renaming a file, deleting a
file, etc..)

Now.. knowing the stock C= kernal routines, you could "emulate" the computer
side of the serial commands for more complex drive useages. The important
routines...

(SA=Secondary Address)

ff93 jmp $edb9 secnd Send SA After Listen
ff96 jmp $edc7 tksa Send SA After Talk
ffa5 jmp $ee13 acptr Handshake Serial Byte In
ffa8 jmp $eddd ciout Handshake Serial Byte Out
ffab jmp $edef untalk Command Serial Bus UNTALK

```
ffae jmp $edfe unlsn Command Serial Bus UNLISTEN
ffba jmp $fe00 setlfs Set Logical File Parameters
ffbd jmp $fdf9 setnam Set Filename
ffb1 jmp $ed0c listn Command Serial Bus LISTEN
ffb4 jmp $ed09 talk Command Serial Bus TALK
ffc0 jmp ($031a) (iopen) Open Vector [f34a]
ffc3 jmp ($031c) (iclose) Close Vector [f291]
ffc6 jmp ($031e) (ichkin) Set Input [f20e]
ffc9 jmp ($0320) (ichkout) Set Output [f250]
ffd5 jmp $f49e load Load RAM From Device
ffd8 jmp $f5dd save Save RAM To Device
ffe7 jmp ($032c) (iclall) Close All Channels And Files [f32f]
```

There's probably more to it than what I suggest here... so.. I ain't suggesting it'd be easy... but I think it'd be possible if you could make the physical connection work. I also don't think I'd want to run a 1541 as my main disk drive on my XE but it'd be a cool project for somebody. (and I do understand the original poster wants to just connect the 1541 to the XE and "let it rip", to which the correct answer is "no".)

I guess by saying.. "Not without writing a new brain for the 1541".. you are suggesting the reverse route... because the 1541 can be "re-programmed" (yes.. many copy protection routines used custom DOS routines and non-standard disk formats), you could effectively make the '41 hear "ATARI"... that seems a more complex endeaver to me.... I'd ask my ATARI speak 1541 !!!

(btw.. I believe I saw a complete disassembly for the 8k of 1541 rom online somewhere and there are rom dumps of the C64 kicking around...the books "Inside Commodore DOS" and "The Anatomy of the 1541" would be very helpful, too)

I wish I had the time for this project but it's a bit out of my league... with all the emulator stuff that's possible and/or has been done already, I can't think of a reason nobody has tried this, yet... cycle/timing issues, maybe ??? (shruggg ?!?!)

Ehh.. what-ever.. was thought provoking, none-the-less... :)

later...

1050 has a 6507 with 4k ROM, RIOT, 6810 RAM, 2793 or 2797 controler. About
the only real difference is IIRC, the 1541 uses a 6502 and has VIA to handle
serial communication vs bit banging. Everything else like giving it a
command to format a disk is the same except for semantics.

> to achieve its speed.

My handler doesn't actually support ATASCII functions at all.
Rather a larger part of the handler's time is spent preprocessing
each character and passing all "function codes" to the real E:
handler for processing.

In a way you can say my handler provides better support for
function codes by not supporting them. :-)

However, I will point out that my handler doesn't support direct
OLDCOL/OLDROW updates. That is to say directly modifying the
values in the cursor column/row addresses to change the cursor
position isn't going to work under my handler.

Still, the handler is pretty fast and tightly coded. :-)

Dave

>If you have any questions about learning 6502 plz post.
>good luck
>ps if you start writing and then post your code, I can help you optimize it then
>you can learn some tricks from our land.

is it possible do write 6502 assembler code on a real pc, compile it
with a real pc and just run it on some emulated enviroment just like
the atari800win? If so, it could be easier to do more complex programs
and also faster I think.

What software is needed to do this task?

Yes, I think I may be that guy, and thanks! I'm assuming you're speaking of one of the earlier versions of the handler as I recall only giving out the binaries of the later (faster and improved) handler to close friends, with strict instructions not to give it out. >:((The handler was a work in progress.)

But keep in mind that there are a few 80-column implementations written by others. Though, at that time I wrote my version (~91-93) I like to think mind produced the fastest output. ;-P

Yes, there's a Atari Computer Enthusiasts of Columbus
swap meet Sat. 9/8/01. 9AM to 3PM EDT at Oakland Park
Community Center, 980 Lenore St. Take Broadway or
Cooke exit from 71, in the heart of Columbus. Turn onto
Maze Rd, go north from Broadway, south from Cooke.
Then east on Lenore about a block. The building sits back a little
so look for it. It's not a large building.
http://www.anglefire.com/oh4/acec/acec.html
They charge $6 for a table to sell stuff, $4 entry otherwise.
or you can call Charles (Brown I think), 614-447-9789.

Are you really sure about this issue? IIRC, the 1541 had a disk-layout where
the number of sectors/track depends on the track index, whereas the 1050 uses
a fixed number of secs/track. Hence, I would expect that you would be able
to re-program the 1541 such that it reads and writes its own disks, but I
afraid that these disks will never be readable by a 1050; and reverse, I afraid
you won't be able to read 1050 disks by the 1541. BTW, the number of
bytes/sector is different, too.

So long,
Thomas

5534. Amiga Mogul Manic 'Prototype' and Romox Copy Carts

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-05 14:33:55 UTC
From: Ianoid <"i a n o i d"@ianoid.com>
Message-ID: <tpcdqavji7946@corp.supernews.com>
Source record: 34307
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

Because of my recent dealings with a kid who claims to have a prototype of Mogul Maniac for 8-bit computers, I decided to post the information that I discovered about this 'prototype.'

Basically, my understanding is that it is a copy cart from a Romox copy station. You could go to a shop and have any game from their small catalog put on a blank cart for a reasonable price. This wasn't a common service, making the hardware and software rather hard to find.

Nonetheless, this does not make all carts produced at these copy stations 'prototypes.' Most of the ROMS from these copy stations are archived, which means it would be easy to switch the game on any cart with an EPROM burner.

Here is the catalog I received from Andrew Kreig recently. Thanks Andrew.

```
Manufacturer Catalog # Yr Title
--------------- --------- -- -----------------------------------
Romox 01283 83 Baja Buggies (by Gamestar)
Romox 01223 83 Bartender, The (by Liberty Software)
Romox 13023 83 Castles and Keys (by Romox)
Romox 04033 83 Crash Dive (by 20th Century Fox)
Romox 02234 83 Dancing Feats (by Softsync Inc.)
Romox 11023 83 Flapper (by Romox)
Romox 01213 83 Hot Lips (by London Software)
Romox 01033 82 M*A*S*H (by 20th Century Fox)
Romox 03220 83 Mogul Maniac (by Amiga)
Romox 03213 83 Parallax (by London Software)
Romox 02033 82 Porky's (by 20th Century Fox)
Romox 03033 82 Revenge of the Beefsteak Tomatoes (by 20th
Century)
Romox 12023 83 Ripper (by Romox)
Romox 02213 83 Trion (by London Software)
```

Some of these games are not confirmed- I mean archived, so it's not clear if they were truly available. Mogul Maniac is confirmed, and was before this kid started offering his 'prototype.'

So, for you information, do not pay prototype prices or trade with similar weight, for this non-prototype cart.

-ian

I've got a disk version that has many background images and various
soundtracks. Was playing it a couple of days ago. It exists. I
don't have it in ATR format and my 1050-2-PC cable didn't work the
first time I tried it, so I will have to check my wiring. :(

Hello Robert,
does ATOS work on your harddisk ??? I downloaded the "files3" version (29 or 30 files a 80kbytes), put the files together again and then had a 2.3MB ARC file. Unarced it (with Super Unarc from Bob Puff) and got several smaller arc files (which are similar to the files2 dir). So far so good. But then the final step, unarcing these ARC files failed. Unarc reported "file fails CRC check" several times. So I merely got a partial copy of ATOS which is not working...

Downloaded the whole thing (the files3 dir with 29-30 files) again, unpacked again and got the same bugs again. So I contacted Tom Hunt and told him, that the download doesn`t work properly or might contain defective files. He replied me that he has tested it and found no errors. So, what should I do now ??

There is a "files1" dir, but it contains a 2.1MB ZIP or 2.3 MB ARC file. Since I merely have HD disk drives, I cannot save any of these files to disk. (I am connected to the internet here at the university, they have ZIP drives and Jazz drives avaiable, but I do not have them at home!) Next there is a "files2" dir, which contains some dozens ARC files, which have lengths of up to 480kbytes. Well, I can download these, but at home the next problem occurs - how do I convert a 480k file to the Atari ??? Ataridsk/Hiassoft and many others only support 180kbytes; SIO2PC supports PC files with any length, but: it only writes them to DOS 2 disks (I tried it with Sparta and it did not work at all!) - and how do I convert a 480k file on a MyDOS 720k disk to sparta then ??? Afaik, Sparta and Bewe can merely read 90k, 130k and 180k DOS 2 Disks, but not 720k MyDOS disks... So, thats why I used the "files3" dir, but as said in the beginning (a long time ago) this does not work successfully... Very sad about it - having a real Atari and a harddisk, but no luck with downloading or installing ATOS...
-Andreas.

Yep,
but still DSSD or DSMD (40 tracks, 80 tracks) are no standard formats.
the
same is true for SSSD 80 tracks and SSMD 80 tracks, possible but no
standard !!
to my knowledge, standards are: Single (SSSD, 40 tracks), Medium (SSMD,
40 tracks), Double (SSDD, 40 tracks); with higher drives also 360k (DSDD
40 tracks), 720k (DSDD, 80 tracks) and 1440k (DSHD, 80 tracks); thats
more than enough.
-Andreas.

Message-ID: <3B965747.1D7425CC@mail.uni-mainz.de>
Source record: 34316

Well,
the original Atari bootdisk version has 6 backgrounds. You can find it as a bootdisk from System 3 (european version) or as a bootdisk from Epyx (called World Karate, which is almost the same, but american version; simply a title pic was added). Both versions are also avaiable as pirate copies (in boot-format).

Then there is off course the tape version, which has 3 pics on side a and 3 more pics on side b (only european/british, from system 3). And finally there are some pirated file versions. The file version I have found (from Ingo Tamme) contains part of the Epyx version, it has the Epyx title pic (world karate championships), but only 4 background screens (Greece/Athen and Egypt/Cairo are missing as backgrounds). And thats it for the Atari versions of "International Karate", "Karate International" and "World Karate Championships". -Andreas

Well,
when using the bootdisk versions of Int. Karate and W.K.C. type ADZM to skip from one background to another. This also works with the pirated bootversions and the pirated file version. It does not work of course with the tape version... You can also take out the disk, when the program is trying to load the next screen and insert it later, to skip some screens... -Andreas.

Ian,

They must've started to offer it, then pulled it later on as I have the Winter 84' Romox catalog and the only choice is #9 under Atari 2600 VCS for Mogul Maniac, under the Atari Computers Section of the catalog no listing of Mogul Maniac appears.

By the way, for those looking for anything from Romox that may be out there, here is their info (which of course is long since out of date, however this is a starting point in tracking down things):

Romox
476 Vandell Way
Campbell, Ca. 95009
408-374-7200

This info can be very helpful in reverse tracing the company, people and information. Good luck to all and it would be cool to see if someone can turn up one of the old Romox Eprom stations, it was truly cool idea!!!

Curt

I was taking it to the illogical conclusion, that is if you reprogramed the ROM in a 1541 or a 1050, you could get them to handle the others different formats and commands.

Total RAM in a 1050 may be a problem. Even if you could put all the 1541 track layouts and commands into the 4k ROM, you still only have 256 bytes of RAM.

I thought there was someone from the Netherlands that programed a joystick port to interface with a 1050. I would imagine if someone was really into it, they could do the same thing for a 1541.

I guess I am trying to say it is possible, but the effort is so great no one would probably tackle it.

Well I think he means that the differences are all software, that
with the right brain the 1541 could read and write Atari disks just like
a 1050.

Anyone have a detailed memory map of the 1541? I have a couple
1541's collecting dust.

Steve

>
> What software is needed to do this task?

Yes. I used to use TASM from Speech Technology<?> on occasion. I first
started using it on an ~8 MHz Tandy 1000. It was an OK environment, 80
column editing, file I/O on a IBM vs Atari 1050 was probably 100 times
faster. The assembler itself was probably 10 times faster then ASM/ED cart.

Some of the code I wrote, I ran on Xformer to test Xformer/emulator more then I wanted to run an emulator, but I could have done everything on a PC.

My problems with a set up like that were pretty specific to me and the way I work. I like to use a combination of things like BASIC to make data files and altered character sets for inclusion in my ML stuff. Having 1/2 the program files on either a 1050 or .ATR and the other half on the IBM made for some problems with moving them around. It was always just much easier do everything on a real Atari.

: track layouts and commands into the 4k ROM, you still only have 256 bytes of
: RAM.

It's easy to put an additional 128bytes into a 1050. (as they did in the
US-Doubler).

: I thought there was someone from the Netherlands that programed a joystick
: port to interface with a 1050. I would imagine if someone was really into
: it, they could do the same thing for a 1541.

That should be Richard Vermeulen (aka S.O.D. from A.C.E. (Atari Club
Eindhoven)) I guess.
He made something to read data directly from the disk without using SIO
commands. The intension was to read data from a double-density disk (created
with an US-doubler or Happy) on a 100% standard 1050 drive. It even
partitally worked!

He also wrote a thing to move the head of the 1050 using a joystick :-)

Andreas Magenheimer <magea000@mail.uni-mainz.de>

: Hello Robert,
: does ATOS work on your harddisk ???

ATOS itself, Yes. Some additional things like "Configuration" and
"TextPro"... No...

: I downloaded the "files3" version
: (29 or 30 files a 80kbytes), put the files together again and then had a
: 2.3MB ARC file.

I downloaded the ZIPped ATR version and filecopied (RCOPY.COM) the whole image
to a BlackBox partition using A.P.E. and made the "X33A.DOS" bootable. This
seems not to work very well. I changed it to "X32GX.DOS", modified the
batchfile to use "SHELLGX" in stead of "SHELL33A" and it worked o.k. I
haven't tried it with Ramdisk yet, so it's a bit slow right now since all
overlays are written/read to harddisk.

: told him, that the download doesn`t work properly or might contain
: defective files. He replied me that he has tested it and found no
: errors. So, what should I do now ??

I don't know if you have a SIO-2-PC set-up, but the .ATR worked for me.

: Ataridsk/Hiassoft and many others only support 180kbytes;
: SIO2PC supports PC files with any length, but: it only writes them to
: DOS 2 disks (I tried it with Sparta and it did not work at all!)

Don't see a reason why. I _always_ use Sparta-Dos, and also with SIO-2-PC I
have no troubles when reading/writing to and from an ATR image...

: how do I convert a 480k file on a MyDOS 720k disk to sparta then ???

First, create a Sparta-Dos partition on your harddisk. Copy UNARC.COM to it
(or have it handy on a floppy-disk). Start-up A.P.E and use the PC-mirror
feature. Use "Z" to go to the configmenu of A.P.E. and select the path to use
as your PC-mirror directory. Select "S" to enable the PC-mirror, and select a
drive number (anything but "1" would do in this case).

Start-up UnARC and UnARC the files you want from the PC-mirror drive to your
Atari harddisk partition, and you're done.

: successfully... Very sad about it - having a real Atari and a
: harddisk, but no luck with downloading or installing ATOS...

It's much easier when using an ATR and SIO-2-PC interface. Another way is to
use a null-modem cable...

lmk if it worked...

Hi, Paul!

I really think you're wrong here! I have the original International Karate and the preview version you speak of. The music in the finished version is amazing. Better than the C64 by far! Rob Hubbard really did push the Pokey chip and it's truly great! And IK is the same as World Championship Karate by Epyx in the US.

Try them again and see for yourself, the Atari version IS better.

It's a problem with the WD 1791 chip used in the Percom drives (at
least the early ones). I was the author of the firmware in the Percom
drives and one of the problems we ran into making the drive compatible
with "everything" was the fact that the FDC chip we used was not able
to read a double density 128 byte sector. There is no way I know of
to read an enhanced density disk without replacing the 1791 chip --
and then you will have to change my code to program the new chip
to handle 128 byte sectors. Sorry about that....

Hi there Vidar...

You have to forgive my aging brain cells, I can remember every Archer
game on the atari but not so much this one. Obviously I know the game
in general but for the life of me I still only remember the kilroy
crack :-)

Should some nice person have this in it's whole version I'd be glad to
revisit it :-)

Wow! I didn't realize you were still around; did you get a chance to check Ben Poehlands article from Atari Classics mag? Is his info correct re: the Percom controller? What are its capabilities with drives above 360K? Can it use 1.44M HD disks in 720K mode? What about 1.2M HD in 360K or any mode? I have yet to have any success...

BTW this AT88-S1PD has a WD1795 in it and the AT88-S1 has a WD1771. What do you know about DSSD from those controllers? Or replacing the mechanisms with double sided ones.

DiskMend (sector editor) gets the 4-byte status and reports that the disk is DD; based on that the SIO call requests 256 bytes from any sector except 1-2-3. Somehow it believes it gets 256 because no errors are generated. I can read any sector after setting 26/track, but the bottom 128 bytes are always the same and always gibberish. Must be the MFM tricking it into believing it got 256... Wonder why TopDos, SmartDos and Sparta just grind and die at directory requests unlike MyDos? I see why the file will not load; junk in the link at byte 253.

thx for your help! I really enjoy playing IK on my atari 8bit, and it
might be the technical best and fastest game on it.

as I said FAST, try the following: to toggle the speed of
karate-fighters you can use a combination of four different speed
settings. You can switch it by pressing "x" key , release it, and
press a number between "1" and "4", where "1" is the fastest setting
and "4" the slowest.

I'm wondering, why Epyx didn't set x-1 speed by default, because this
is the most impressive setting :-)

Submit your url there if you want to get in the list...

: Also, anyone know where I can get a copy of the 'pool disk'?

The Pooldisks are PD and may be freely copied. Just ask someone if he want's
to make a copy for you.
Note that there are 3 Pooldisk CDR's. PoolDisk (1 CD) and PoolDisk Too (2
CD's).

You can order one directly from the authors (Bo and Ernest Schreurs) too.
Send me a private Email...

5566. What is a Eprom/Eeprom burner worth?

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-06 11:32:30 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0109060332.2dbca643@posting.google.com>
Source record: 34340

Hi all,

Somebody has offered to sell me a large lot of Atari equipment
and documentation. Included in the lot is an EPROM burner. If this
indeed turns out to be a functioning EPROM burner that can be used to
create Atari cartridges, what is a fair price for it?

I have a picture of it. I looks almost like a standard Atari
cartridge. It is orange, and has a label that reads:

Proburner
EPROM/EEPROM Programmer
For use with Atari
Models 400, 800, 600XL, and 800XL
Manufactured by Thompson Electronics
Toronto, Canada

E-mail me if you would like to get a picture of it.

I am trying to determine a FAIR price. I do not want to create
ill will by taking advantage of their ignorance or mine. 8-)

Also, does anybody know where I could get blank Atari EPROMs? I
figure the availability of EPROMs will affect the worth of an EPROM
burner.

Anybody got any ideas?

Thanks,
John

Jheitmuller,

I not fully sure on the value of the Proburner. But it is limited to doing
EPROMs up to 27128's. So this EPROM burner is really only of value to someone who wants to burn stuff for 8bit carts / OS's / and 2600 / 5200
stuff.

Also, it is limited in the programming algorithm's...so it may not be able to
burn every EPROM out there. I ran into this similar problem with my Super-E Burner. Intels and National Semiconductor EPROMs worked fine. But I couldn't get reliable burns on off brands like SEEQ.

Don't get me wrong. It's a good burner. Will work on just about any Atari 8bit computer (not sure on the Atari 400).

Glenn Bruner
glenn_b18@yahoo.com

P.S. - my first EPROM disaster was with one of these. I was reading the OS from my 1450XLD computer with one. I was new to this. And if you don't carefully observe the label and orientation for the chip, you can
plug them in backwards. I ended up frying the chip. Thank goodness for a helpful person in California who used to have a whole stockpile of this

stuff and burned me a new copy. For info, he doesn't have this stuff anymore.

Actually....

There was a Home Pong commercial by Atari in 1976, I'm trying to have it converted from 16mm to VHS then I will put it online for everyone to enjoy. The commercial you link to is a 1982 commercial, also is a video stolen from Tony Ramos' video archive, he's the one who first posted any Atari video's onto the internet.

Not reliably if at all if it is a stock 1050. There are several utilities
out that will do it for modified 1050s that support 256 byte sectors.

If you are savy enough to swap drives and set up a PC with a 360k drive, you
are plenty smart to put together a SIO2PC type cable. It works much better
to just use an SIO2PC cable with either APE or SIO2PC software running as
D2: and just duplicate the disk or move files to the real 1050.

Some of the older drives run into alignment problems. They work fine if you
just use disks formatted in the drive, but run into problems if you start
swapping disks from another drive.

> Anybody got any ideas?

Adding to what Glen said, it only does EPROMs with 21V programming voltage.

I paid about $150 for one new, the thing never worked right. It had an
option to run from the newly burned EPROM, but everytime I tried to use it,
it fried the EPROM.

I modified mine with a daughter board so I could use 12.5V EPROMs and
eventually added a switch so I could burn 27256 EPROMs.

I loaned it out to a guy that was working in a hospital, using micros to
help handicapped. Came back broke which was the biggest favor anyone had
ever done for me. I bought a Needam PB-10 and never looked back.

I think what you will find is that people that actively work with EPROMs
still, like small production runs of 10-50 EPROMs, will have moved on to
more serious equipment.

So your best bet would be eBay and finding a collector. I think I would be hard pressed to keep a straight face if someone paid more then $50 for it to use it. I could see a collector going over $100 to have it.

You can order the Pooldisk Too cd set from the creator at this web
page:

http://members.home.nl/stack/atarixle.html#POOLDISKTOO

Its one of the best things I've ever purchased for my 8-bit, worth
much more than the few dollars they charge to send it.

Some parts of the disk cant be copied without permission, but most
of the PD files off the ATR disk are on my Pooldisk Online site at
this url (with permission):

http://ape.dyndns.org:8080/

Of course there is a another whole CD full of goodies you get by
buying it from Ernest.

> does it require a special disk, or would any 5-1/4" PC floppy work fine?

With an APE or SIO2PC interface you can load the disks direct from
the PC without even having to write them out to disk. With the same
hardware you can also make real disks as well if that suits you better.

You can find for information on APE at the URL below.

Yep, actually the lastest iterations of MyDOS were done by Bob Puff
and friends, I think, much like the last firmware on the Percom drives
(I stopped working at Percom shortly before they started on the hard
drives and other higher dollar products).

Hi Tony,

Just wanted to say thank you for creating and posting the Atari
commercial movies files.

I've really enjoyed your movies over the years, but was never able to
get the "States and Capitals" mov file to render in any quicktime
player that I tried. All the other files work great. Just wondering
if it got corrupted during the posting and if you have another copy
archived somewhere? I suppose chances are slim since the files have
been there for several years now.

Thanks!

Ouch! More questions that I expected, for sure!

I haven't seen the article, and I might remember things wrong too
(especially when you get to details!). There is no real issue with
the Percom drive's architecture when it comes to reading and
writing HD disks, but if I remember correctly, the 6809 was running
close to the rail handling DD disks (we did not use any DMA, just
the FIRQ to simulate a DMA channel). So that might keep you
from using any HD disks without some hardware hacking.

The 1795 (again, if I remember correctly) did work with 128 byte
sectors, so you should be able to read and write ED disks with
it (as well as everything the 1791 handled) -- but getting firmware
to do that might be a bit harder. I'll look around for old listings
that could point out where the fix should go, but I offer no
promises -- that was a long time ago! The 1771 is the original
chip, single density only, so it is by far the most limited. You
might be able to replace it with a 179x chip (I don't remember
if they were pin compatible or not, so don't take this as advice!).

Were I still at Percom when they put out the AT88-S1, I'd
probably use the same firmware for all of them, so it probably has
the printer and DD support in it (just not the hardware ;-).

Finally, you are using a drive with the WD1795 when reading
the disk with DiskMend, right? The drive is reading the
128 byte ED sectors (all of them are 128 bytes long on an
ED disk), and transferring the 128 real data bytes and the
128 bytes of junk from power up or the last DD sector you
read to finish out the 256 bytes in the sector buffer. That's
also the problem with SpartaDos and TopDos (I don't know
about SmartDos) -- they use all 256 bytes in the sectors
used for directories, but to save code space in MyDOS, I
only used the first 128 bytes so the code for single and double
density directories are the same (smirking, I notice that I
get credit for smarts when I was just lazy!).

I have a large selection of classic computer and video game hardware, software and accessories for sale, many from private collections. Many of the items and game titles (for Intellivision, Colecovision and Atari) are still available in shrink-wrapped/brand new form, ideal for anyone just starting a classic computer or videogame collection.

Currently I have items for the following models/systems...please email me with the categories you are interested in, to receive a detailed listing.

- Atari 8bit Computers
- Atari ST Computers
- TI 99/4A
- Commodore 64
- Commodore Vic 20
- Commodore Amiga
- Mattel Intellivision (over 50 sealed titles available)
- ColecoVision (over a dozen sealed titles available)
- Atari 2600
- Atari 5200
- Atari 7800 (over a dozen sealed titles available)
- Atari Jaguar
- Vectrex
- Mattel Handheld Games
- Coleco Handheld Games
- Classic Computer Magazines (PC Magazine, Compute, Antic, PC World)

If you are interested in any of these items, please respond by emailing me at jim_l@NO.SPAM.telusplanet.net?subject=Classics (removing the 'NO.SPAM'. first). I am located in Edmonton, Alberta, Canada, but ship worldwide, dealer inquiries are welcomed. I am also willing to accept trades of certain classic computer, video games, and handheld items, please contact me for our want list.

Ok, once again, "I'm baaaack!!!" :)

I've been trolling a bit on c.s.a.8 recently (mostly skipping random disk drive tech questions and Ebay postings), but now I'm actually back in the groove, officially. :)

My desk is now the proud placeholder of my Atari 800XL and Commodore (model something-or-other) monitor. :)

I've got myself set up with an SIO2PC cable again, and have, as of last night, FINALLY got DosEmu working on my Linux box. (By working, I mean able to actually access my Linux filesystem, so I can get to programs like SIO2PC and APE, and access my ATR files.)

I also finally was able to build a floppy-disk copy of my last game, "Gem Drop," for a kid who e-mailed me long, long agao asking if he could have a copy. (He only had a WebTV for 'net access, so he needed a floppy. Step 1 was trying to _FIND_ 5.25" floppies in this day and age!)

While I was playing it last night, I had the sick thought of releasing a "Special Edition" of the game. It would pretty much be identical to the current one, but I want to try and convert the cool, 3D-rendered graphics from my Linux port (Gem Drop X) into SuperIRG. :)
(And maybe re-do the intro animation)

Also, Video61 guys, I'd still be interested in a cart. copy of the game being made, if we could figure out how to fit the damned program ON a cart. :)

Anyway, I'm back... and I almost remember how to program Action!

You've been warned. ;)

-bill!

5585. APE on DosEmu

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-06 19:46:35 UTC
From: William Kendrick <nbs@bolt.sonic.net>
Message-ID: <voQl7.102$si6.842@typhoon.sonic.net>
Source record: 34210

I'm using DosEmu and Dr-Dos 7.03 eval. on a RedHat 6.2 Linux box,
and am trying to use APE 1.18.

It almost works (I was actually kind of surprised when the MyDOS menu
finally appeared on my Atari's screen after all of the sputtering
coming out of the speaker), but has, umm... speed issues, I guess. :)

The APE docs. mention how to alter DosEmu 0.9-or-so's source code to
provide better speed. (Unfortunately, the RH box isn't on a network,
so I guess I'll need to download DosEmu source over my OTHER box's
modem and split it up into disks.. <sigh> :))

Do people have any other suggestions other than what's in APE's docs?

In the meantime, is "femul" still being developed? (It's years old and
still alpha :( )

What about a Linux port of APE? :)

Thx!

-bill!

Hey, Charles;
Thanks for what you remember; hated to unload on you, but there is so little of that stuff documented and nobody I know to even ask until you ...

I put Ben's article up on my Atariland site; it has the only technical details I have found on the Percom hardware, and he is mostly generalizing from his observations of a half dozen units. He has used 720K drives on an RFD controller and admits that 1.44s are an unknown. I have tried the 3.5 & 5.25 HD drives in all of the MyDos configurations including the 77 track 8 inch with zero results; the drives appear to accept the settings and then lock up during format. They just spin forever until the controller drive is re-started.

My Percoms have been very rugged and dependable; they do great with 360K generic mechanisms, even though limited to SD on the plain AT88-S1 models; still it does DSSD for 180K in one contiguous block.

Just use the set directive<$491? and some other location?> with Action! at
$A000<or $8000 if you need 16k> and the compile to disk hack.

hi bill,
i do have it listed for sale under the 400/800/xl/xe cartridge list,
here is a cut&paste off of my web site. you will find it listed.
i do not have pics of the games because i try and keep it simple for
the non graphic style terminal and browsers that many atari users use,
but i am thinking of just a page dedicated to pics of the new carts, we
will see.
here is the list,
$19.95 AMAZEMAZE 48K
$19.95 ASTROCHASE 16K %
$19.95 ANIMATED PUZZLE 16K
$19.95 AIRBALL 64K

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

5597. Can I use a text source file w/ Atari BASIC?

Newsgroup: comp.sys.atari.8bit

Hi all,

I have a large Atari BASIC program that I am going to be entering
from a book by hand. Sound familiar? Anyone... Anyone...

I would rather key this program into a full screen text editor on my
PC and transfer it over to my Atari 800. Which I can do. I have
Steve Tuckers APE software and a SIO2PC cable.

Can Atari BASIC use an ASCII text source file? I have looked at
BASIC programs that I have keyed into the BASIC interpreter and save
them to disk. They are not saved in a text format. I am not sure
what format that are save in, frankly.

Any ideas?

Thanks,
John

>I have a large Atari BASIC program that I am going to be entering

Sure. Save your file as a text file on your PC, then transfer it to your Atari. Like as not you'll have to convert the carrage returns to ATSCII style CR's, there are any number of converters to do this for you. Once thats done, boot up your basic and type, "enter D1:filespec.txt"

Your text file will now be loaded into the basic editor ...

I wrote a modem game way back when. Been so long, I can't remember the old MS DOS commands, but there used to be something like CTC or change the consol.

Couple of posibilities. One is echoing input from the Atari through a SIO2PC cable acting as the I/O device for an IBM hooked up to the net. Just ignore the garbage that happens on the IBM screen and you could play head to head modem type games over the internet. Maybe Wizards of Wor type team play.

It would also let mutiple systems get involved in things like card games over the net. I have heard they are really popular with respect to numbers of players and the fervor they play with. Doesn't matter if you have a VGA monitor or a 13" color TV hooked to your Atari for displaying your hand.

You could also off load a lot of storage to game server. There are several games out like EQ, AC, UO, AO, that maintain their maps on a server. Not that anyone would want to do it, but you could have a Pacman playfield that was 60 gigs.

I think simple multiplayer games could be done using a chat channel for example. Just use ASCII tokens for player movements or actions. [A, B, C, D] => [up, down, right, left]. Parse the leading text, "Kendrick says;A" to ~move Kendrick's player up one.

Not a huge problem if you have room. Most EPROM burners include the ability to specify location you program. For instance, you have a 6k program with a separate 1k character set. You would just set the character set for a fixed location in ROM<$B800 for example> and use the Action! compile to disk option to compile it at $A000.

Load the .COM file into the burner and burn it starting at EPROM location $0000 to $17FF Load the character set file into the burner and burn it at $1800. You then just write the entire EPROM out as a single file from all subsequent burns. I need to pull out my programmers calculator to get the numbers right, but that is essentially the method I would use.

Worse case is you have a simple block move program in the cart that puts your code and data where it wants to be then jumps to it. I've done this ugly before too. Just something like cart run address points to.

```
LDX #0
LDA $A000,X
STA $2000,X
LDA $A100,X
STA $2100,X
...
INX
BNE $A002
etc.
```

I am writing a multi-player networked game for the PC and was thinking
about how to port it to the atari. I think the only way would be to
do as you suggest, using the PC for networking and displaying the data
on the atari through a SIO2PC type cable. Don't hold your breath
though, it's years off. ;)

You could design a multi-player pacman. Anyone ever done that before?

I am proud to announce the Atari Program Exchange archive.

http://www.atariarchives.org/APX/

The APX archive offers information about the Atari Program Exchange and downloadable software. All the software that's avaialble is with the permission of the copyright holders, so it's nice 'n legal.

Currently, 62 APX titles are available for download. A list of downloadable titles is below. The archive is far from complete, but this is a start. Even if a program isn't downloadable, the site offers information about it.

Want to help? If you can put me in touch with APX authors that haven't yet been contacted, or provide APX software/catalogs that aren't yet accounted for, the archive will be better for it.

5603. Anybody got the source code for the Mansfield Simple Assembler?

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-07 21:58:38 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0109071358.2377f972@posting.google.com>
Source record: 34227
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer

Hi all,

I am working my way through the Richard Mansfield book; Machine
Language for Beginners (c)1983. As anybody got the Atari source code
for the SIMPLE ASSEMBLER already keyed in. If you do could you either
post it to this news group or e-mail it to me. It would be greatly
appreciated.

An .ATR disk image would be awesome!

Thanks much,
John

Two player type games with the notable exception of MULE were the standard.
I think there were a few hockey and pong variations that allowed for more. I
think MULE has so many fans, people would be happy to see a hack of that
playable over the net.

I don't know exactly how chat channels are hosted, but unless there was some
method of preventing multiple people on the same screen, you would
eventually run into band width problems.

I kind of sieze on the chat channel model since I wrote an interpreter that
understood high level BASIC like commands.

I think you could get reasonable performance out of a chat channel with
maybe 10 participates. Looking at most of the online games now, they only
take up about 3k of bandwidth. Shouldn't be a problem running a game on a
2400 baud SIO2PC connection with 10 players. Beyond 10, you would need
something to steer data to only those close enough to each other to need

updating. If you could get everyone in the chat channel to assume a one character identity like 'A' or 'B' it would be a bonus.

5605. "Good 1050" -- "Bad 1050"

I have an interesting pair of 1050's. One was an extra-clean, stock 1050 that reads and writes flawlessly. The other was a high-mileage 1050 Happy with Happy Controller which was flakey -- worked, but had lots of write errors. So naturally, I decided to put the Happy Enhancement and Controller into the "good 1050". Voila'! Now I have an immaculate 1050 Happy. Then I took the 6507 and the Rom (removed for the Happy installation) and put these in the now-stock "bad 1050". Dead as a doornail! The Power light comes, and that's it. Swapped the 6507, Rom, 2793, and 6810. Still dead. I've haven't tried to trace the power through the drive yet, but I'm perplexed as to what might have happened. Any thoughts?
Larry

Did you check the ROM jumpers? Atari came out with at least two different
type ROMs that required different jumpers.

It was never released for the A8. But back in '96 I produced an A8
version of their Beyond Zork mini demo. Here's the file description found
in it's .DES file:

====
Mini Zork

Infocom <never> released this for the
atari 8 bit. It <was> released as
a c64 mini game, a demo. Well, here
it is, running the CTH Inform
Game Interpreter!

Brought to you by Closer To Home
Enterprises!
====

It can be found at:
ftp://ftp.spudster.org/pub/Atari/CTH/Cth_Shareware/tgames.arc

Unfortunetly part of my inform/Z-Code development system for the A8 is now
locked away in storage. If anyone is curious and wants to learn more about
Z-Code or the games I produced for the A8 you can read about it at:

Ok I relent? But when I had a company send me back a payment, they stated that Pay Pal charged them and the amount I was to receive was not the total amount that they had collected. I don't have a problem with either personally. If someone gets charged on both ends like I did then I thought they should know.

I have delved into the Percom Disk Drive for several years. It does not like to be the second drive on the system. Straight fact. You have to boot a Percom drive and it's slaves with a dos that does recognize all drives, on first booting. It will not read all drives added to the booting? Help? maybe so maybe not. ?? I ran a BBS with a double density double sided disk drive and 3 slaves, that were double density and double sided disk, the latter drive was a double sided 720 3 1/2 inch disk drive and percom will read these today provided the dos boots them on initalisaton.

I still use a Percom to read disk of 720k written on a modified XF551 with no errors. GO FIGURE?

Check your rom jumpers, the white ones behind the chips. If they are set to 1 and 3 on the board move them to 2 and 4. If they are set to 2 and 4 then move them to 1 and 3, and try it again. Should solve your problem.

you owe me one little one?

Well when all else fails, read the Read.ME file that was provided. I think but may be wrong, have been many times in the past! If you formatted the disk with Sparta and it does not work, take the same disk and when sparta is loaded type in boot D1:X32?.DOS, the ? being the version of Sparta on your disk then try it again you may find it actually works. Or just format a disk then copy over the X3??.DOS to the disk and type in Boot d1: X3??.DOS and it should boot giving you the D1: on your screen?

> What software is needed to do this task?

This should be a faq of some type! Yes you can develop completely on PC. I do for the c64. Someone else here should have answered by now, as I'm no expert on Atari, but the basic setup is notepad to write code, a command line assembler (use doskey, then it's two keypresses to reassemble), then convert the binary into the right format to load into the emulator (in my case I found an assembler that directly creates emulator type files), then attach the image in the emulator - at least for commodre emulators, you have a simulation of a disk or tape as an image file, once you attach that file then you can load programs off that file through the emulated machine, in my case I attach test.d64 as a disk image, then in the 64 itself type LOAD "assembler",8,1 and start it with SYS49152.
I don't really know how to do the equivalent in Atari, but to run assembly programs on Atari I used to POKE data into $600 or 1536 and they type DOS as that would start the program. Problem is, this is meant to start a menu program that lets you access your disk drive, but I never had a real disk drive. The other way to start assembly from basic is the usr(x) function. If you check a memory map, there's a USR vector, you poke that with the start address of your routine, then type x=usr(1) in basic. The "1" gets copied as a 16bit value somewhere if you need to use it, then your routine is called, and you can pass a value back.
Is there a SYS command in atari basic?

> RAM.
>

Hi,
you seem to know it pretty well, I was wondering if they could reach each others disks. It all boils down to one thing, the 1541 has 4 densities, one of which is 250,000 bits per second, I can't remember the other ones - it has to do with some clock divided by 12,13,14 or 15. Should be able to work backwards actually...
Anyhow, at the most basic level a byte is put in a shift register which writes the data at that rate. Each one is represented by a change in magnetic field - imagine little bar magnets on the disk. Where two magnets are repelling, that is read/written as a one. Where the magnets are stuck to each other, it causes a continuous magnetic field so you can't read it.
In other words, only "1" is written to a disk, and the time between "1" is assumed to be 0.
For this reason, you don't want too many "0" in a row or innacuracies in the disk RPM could make you read an extra or too few. So 1541 uses a GCR code, Group Code Recording. This encodes a normal byte into 10 bits, and these 10 bits are select few. It's those codes which have no more than two "0" in a row. Other ways of doing this are called MF, or MFM, or RLL Multifrquency, Modified MultiFrequency, Run Length Limited.
None of that really matters - the only thing that has to match in the two disk formats is the basic bit density. If it's the same, the 1541 can be programmed to read it. Heck, with a slight mod involving increasing the density clock, the 1541 can even directly read PC disks. So I'm sure with a similar mod you could read almost any disk anyhow.
So, do you know the density for atari?

Several options, John...
First Atari Basic *cannot* use ascii because it is line oriented and would never find the $9B end of line.

However, TextPro likes them just fine and has a global replace mode; you can do Ctrl-G to convert Esc, Ctrl-M, Esc, Ctrl-J to Esc, Ctrl-LeftArrow and it cahanges all to Atari Return's. Save it back out and then ENTER it into A8 Basic as a LISTed file.

Another handy utility is Ken Sider's W95 Image manager; it allows you to import/export files to the .ATR in binary or translated text format. All that remains are the inverse and control character stuff to clean it up.

Main thing is to pretty much stay with the LISTed files, although I have also typed in WordPad, import translated text to the .ATR, ENTER into A8 Basic on emulator, SAVE tokenized file back to .ATR, export binary file from image, AtariLink the file to a SSDD disk and LOAD it on a real 8-bit... whew!

Bob;

Do you or Charles have any idea what might prevent a 1489 SIO2PC from
working with a Percom?

I can boot from the PC .ATR and transfer files to the RAMdisk until the
connected Percom is powered up and I can't read or write the Percom until
the SIO2PC cable is disconnected...

You can poke into page six, but execution is X=USR(1536) to start running at that address; the USR(addr) is essentially our implementation of the SYS command.

USR(addr[,P1, P2..]) is *not* a vector; it is a function that acts on the first parameter in the parenthesis as an address for machine code execution. Any second and following optional parameters are converted to 16 bit numbers and placed on the 6502 stack; your routine must clean the stack before the RTS back to Basic.

Typing 'DOS' will *not* execute code in page 6 unless you put the '1536' address into page zero locations 10-11 which is the vector Basic looks at to find where to run the file management system program.

I'd have to check my schematics, but I am pretty sure the Atari uses 250k bits/sec. It only does FM and MFM.

The only other oddity about the drive is everything is written in inverse format to IBM, not sure about the 1541. That is an 'A or 65 is written out as 65 XOR $FF. You have to XOR all the data you pick off the disk with $FF to get it to make sense.

Stock disks are 128 byte sectors and 18 sectors/track. MFM are 26 sectors per track of 128 byte sectors.

5624. Atari - VGA - TFT

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-08 22:50:43 UTC

Is anyone out there using a VGA convertor or a TV / Video-In PC card with their A8, and hooked up to a TFT (flat panel) display? I'm thinking very seriously about getting one, but would be interested in other's experiences, if anyone is using this set-up.
Thanks,
Larry

Interesting idea. IMO, only the 1200XL is stylish enough to be paired
with a TFT monitor. I bet most people would never guess it was a 1982
machine if you paired a mint 1200XL with a TFT. (Until you turned it
on I suppose, LOL.)

Although I loved the original 800's style, it just seems too massive
to be paired with a TFT display. The 800XL and XE lines just look too
cheap.

If you try it, please post your results.

>a 1050.

Am I confused or wasn't the original question...

From: "Marko Borsic" mborsic@t-online.de
Date: 9/4/01 6:09 PM Eastern Daylight Time

"I got an Atari 130XE, but no floppy drive. Can I use a Commodore 1541-II?"

As I understood the question Marko wants to connect a 1541-II to his 130XE and
the thread has gone into reading 1050 disks on a 1541-II. I guess a logical
assumption would be that you'd want to read and write Atari on it.. but...

I don't think anyone is following my idea... I was thinking more along the
lines of letting the 1541 function as a 1541 by using GCR encoding, it's native
densities, etc.. and just reading and writing data, using the Atari computer,
into and out of it, since the CPU, stock routines, ram and buffers all already
there, self-contained in the 1541's 8k of rom. Why would you need to write a
1050 format on the 1541drive ?? Just because it's connected to an Atari ??
Think of it as a "new" DOS. All that has to happen is getting the Atari to
transfer the data to the '41 as it expects to "see" it. The "talk" routines
taken from the C64 kernal rom could be emulated on the Atari and as far as the
1541 knows... it's getting it's data from a C64 !!! I think this would be
rather easy to impliment. The actual physical connection would be the road
block.

No, you wouldn't get a 1050 compatible disk when you write the disk, you'd get
1541 format, but you could use the drive on your Atari !!! We Commodore users
already can do this with the X1541 cable, Star Commander and a PC (the '41 has
no idea it isn't a C64 that's "talking" to it).

> Anyone have a detailed memory map of the 1541? I have a couple

From: Anthony Ramos <aramos@ele-mental.org>
Message-ID: <B7C0510A.1079C%aramos@ele-mental.org>
Source record: 34156

Hi everyone,

You might think I'm crazy for making this trade, but the Rana 1000 was my first A8 disk drive and, unreliable as it is, it's very dear to my heart.

IIRC I can power it with an ordinary A8 computer power supply. If that's true, I'd like to make an even drive-for-drive trade. I will trade power supplies also, if it uses a special supply.

Thanks for looking,

Anthony R.

No, I don't. I don't claim ownership of the material. I'm just miffed that
they took advantage of the work I did procuring, capturing, compressing, and
freely posting the files to sell ads.

When you go to a site like www.atariage.com, they have all the ROMS
from old 2600 games, which is great, but what I'd like to know is
whether these ROMs,
or to be more precise, these .bin files, are from the NTSC version of
the game or the PAL version. They can't be both.

I have been scraping out a bunch of Atari junk? Junk is not really JUNK, but to my spouse it's all JUNK! Let me take a look at what is left, not much but may come up with a Rana with all the components intact. I know there is one with the red cover for the track system gone but may have another buried in some stuff. The Rana drive is the only drive built for the Atari 8-bit that will format a disk off-line, no computer required, but the drive they put in it has tracking problems.

Gamelink 1 uses joystick port 2 on each machine. Gamelink 2 uses the SIO port for 8 machines.

I have GL1 and GL1 Battleship as files on my site(www.a8maestro.com...atari...8ball...software...games), cause I don't use emulators or images much.

I'd have to search more to find modem chess and modem battleship, but I can post them to my site as well.

I honestly don't know, but this I do know. I don't or have not used the atari to pc cable. The Percom, is picky. If you booted with a double sided double density 720k disk on the Percom then the IBM should read it. I have not delved into formatting a 1.4mg drive on the Percom, so can't help you there. What have you got to loose? TIme is on your side, try different drives attached to the percom but use a dos that will recognize all formats, when booting.

Since 720K and 1440K are 3.5" formats, so you can add 1000K DSHD 5.25" size too(I use it as lot).

I consider SSMD to be just ED as it is 1050 SSSD with 26 sectors a track..

I believe all of the programs were from the magazine(though some may be special or modified from the magazine), so if there were magazine disks that would be the place to look, as well as online databases, as well as user group libraries. I am sure ours has at lest some of them.

You can't just copy Sparta DOS or any other DOS to a disk except from the DOS,
in order to transfer the boot sectors, or without using a special program.

You'd be better off copying the .DCM file to a disk, then on a real A8, boot
MYDOS and run Diskcom to create a real Sparta DOS boot disk from the .DCM file.

> ...but the drive they put in it has tracking
problems. <

Hi Bob-
Recently, I attempted (and failed) to put a a Tandon 1050 mech. in a Rana. I am about 95% sure that I got all the wiring figured out (including the R-W head). The drive would spin correctly and seek, but I could not get it to read or write. Have you ever tried putting a different mech. in a Rana? If a Tandon could be put in there, it would certainly solve some problems.

I didn't see Kevin's original posting (yet?), but I have the Speedscript sourcecode from the Speedscript book typed in. It's ready to run, I even corrected some mistakes. Don't have the remarks though, but might consider typing them in...

So Kevin, mail me if you're interested.

Why not scan the book, OCR it and merge the texts into a single file and
load it into your basic editor/compiler.

Most often they will be NTSC. A lot of the pirate stuff is PAL, but
there hasn't been a big movement to get PAL stuff dumped otherwise.

John;

That is a good book; my dog-eared copy is nearly falling apart. Be cautious; IIRC, their explanations of the BCS and BCC instructions were exactly reversed.

You can sure learn a lot by going thru their code and typing it into the system, but I would recommend Synassembler, Mac/65 or the Atari MacroAssembler for any serious development work on the A8. The old ASMED cart is even not bad to learn on with its fairly adequate monitor/debugger.

I guess I did not make myself clear; with the sio2pc attached, I cannot get
any response from the Percom drive or any slave drives.

I have only tried Sparta 3.2d, SpartaX and MyDos 4.53 on the 1.2 and 1.44
drives controlled by the Percom; none get any response from the high density
drives in any combination of density (sd, ed, dd), sides (ss, ds) or tracks
(40, 77, 80)

Try using a 2-chip cable that has a tri-state. The interface your
using may have an internal pullup to 5V thats too powerful for the
outputs the percom is using.

Steve

Most network games would have code that only updates objects that the
player would care about. Further objects are updated less often,
etc..

I don't see a big problem, except that for a mixed platform type game
(PC + Atari 8-bit) you would have some disparities in game play
(timing, prossibly graphics, sound, etc...)

In my mind the hard part is the program that takes the incoming data
from the internet and pushes it through the SIO2PC cable. Probably
because I've done the other part already.

The SIO2PC cable could run in RS232 mode. Just be a standard terminal type
program getting the info out of the chat channel and parsing it.

For example, if instead of incremental player movements you just parsed the
incomming text from each user.

Using M as the token for move player and the next two values as positions.

Kendrick; MAC
Cortese; MCB

Would be interpreted as ~Move Kendrick's icon to position (1, 3), Move
Cortese's icon to position (3, 2)

Joystick movement would be interpreted as both an icon move and translated
into movement to be sent to the chat channel over the RS232/terminal. i.e.
Joystick up moves incon up one locally and "MAC" is printed to the consol
via RS232.

I didn't want the negative, but I don't think it's worth it. I think he
already sold them to another one, even though he gave me 3 days (well, for a
couple of minutes anyway) to pay.

I do believe I have to take the negative now!

What an @$$hole!! If eBay does try to 'warn' you about paying up, you should provide the full detail as you didn't know the seller in question was the same person that ripped you off earlier. You may not get much recourse since the last deal was not within eBay.

Knowing some scammers, he might try to change the user ID to mask his past.

And thanks to ebay's new email policy, you'll have no way of knowing. The
only way to get a user's email address is to win an auction from them or
send them an email (through ebay) and hope they reply.

Spam sucks, no doubt about it. But I'd think protecting ebayers from
potential scam artists would be a higher priority.

The Ultimas have a cult like following, as such it more about the
"mortification of the flesh"<right term?> to prove their faith then anything
else.

I've heard a lot of the same type of relic hunting went on in the early
stages of the Catholic Church. Things like grave robbing to get bones of
saints, beating oneself with rock and brambles.

This is good goods . . .

>
> Seaquest for Atari 2600
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273406719

Ditto . . .

>
> Sky Jinks for Atari 2600
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273406978

Got it . . . Play it constantly, actually . . .

>
> Spider Fighter for Atari 2600
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273407317

Eh . . . Had it once, would have no trouble finding one . . .

>
> Star Wars: The Empire Strikes Back for Atari 2600
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273407840

Nice, the only one anybody (well, everybody) had/has . . . Of course,
it's the only remotely playable SW game, IMO . . .

>
> Tennis for Atari 2600
> http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273408172

Got it . . .

Dude, if you get good deals on these, break out the Dom . . . Better
than the guy who wanted to trade Combat, Asteroids, Pitfall, et. al.
for like whole systems on a board . . .

hi there,

go to this link and you can find various lcd displays. wether or not they will work i don't know, however it looks like if you are good at electronics, you *might* be able to make some sort of an interface.

http://www.allelec.com/

i hope you are good with electronics, LOL.

if you wanted it to be kinda plug and play, you would need to go the route of using something like a video converter or a upscan device and then buying a standard lcd display unit.

thanks
bo

Louis Spears... Hmmm... That name sounds familiar for some reason. I want to associate it with someone named Louis C-Cal and I don't know why. I seem to recall that the latter name was a troll who vanished right around the time that Tyrone started trolling... Of course I could be wrong.

Anyway, it's all besides the point. The point I wanted to make is the same thing I've said over and over and over. Don't do business with anyone whose only online contact is an AOL account. Period.

I don't agree with that! I think everybody deserves a chance and I've dealt
with many AOL'ers that were excellent to deal with.

I have to tell this group what I'm telling everyone.

We mourn, of course, the loss of life, the injuries, and maybe, in time, the physical and economic damage that was done here.

But I see unity in this country that I haven't seen for a very long time. I see anger, and a resolve to find the people responsible for what happened and bring them to justice. We'll afford them the rights under our system of justice that they didn't have the guts to offer their victims.

This world _MUST_ unite against terrorism. Then and only then will there be hope for peace.

Thanks for your thoughts and prayers.

Alan

Hi, I'm Ben Smith of Bravo Sierra Computers. I sell Atari Computers and Atari Jaguar Games. The Great Communicator once said, "It's a Recession when It's in your Neighbor's back yard. But when It's in your back yard, it's a Depression!". Usually Atari sales depend on Customers with extra income. Money over and above what it takes to pay bills. This has cut into my livelyhood. With the current economy as it has been. I'm looking for Atari Customers with extra income! Especially repeat customers familiar with the way I do Business! My Specials, Sales & Discounts still apply! So check my HotLinks below, E-Mail me at atari@pacifier.com or call Ben anytime at (503)256-9974!

http://www.pacifier.com/~atari/specials.htm Current Atari Specials.
http://www.pacifier.com/~atari/ Benjamin's WebSite.
http://www.pacifier.com/~atari/jagsales.htm Jaguar Catalog Link.
http://www.pacifier.com/~atari/free_cat.htm FREE Catalogs info.
http://www.pacifier.com/~atari/catalogs.htm FREE Catalogs area.
http://www.pacifier.com/~atari/testing.htm My Test Standards.
http://www.pacifier.com/~atari/antispam.htm Spamming News!

Check HotLinks above for specials on my WebSite! Two 20% Atari Discounts! General 20% SoftWare Discount & Repeat Customer Discount! 20% off all SoftWare for Atari 8 Bit & ST! And if your a repeat customer, 20% off ST & 8 Bit Hardware/Accessories, Software/Games, Books & References. Discount does not cover Happy Drives, xf551 Drives, Monitors & Jaguar! Discounts are like coupons, redeem by requesting Discounts in E-Mail.

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Thanks for your thoughts and prayers. Way out here in the state of Ohio where I live I know of more than a dozen people that either lost someone, or knows of someone that was lost in the WTC. We have been in a state of shock. My own emotions have been running across the whole spectrum. But emerging from this state of shock is a unity that I have never seen in my life time, and have only heard about from my father from the great challenge that his generation faced. Thank you for the kind words. They <are> appreciated.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

5704. Atari 800 emulator supporting "memory snapshots"

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-14 13:24:00 UTC
From: Chuck Wiggins <cwiggins@one.net>
Message-ID: <tq41pt6rjv849a@corp.supernews.com>
Source record: 34128

Does anyone know of Atari 800 emulators that support "memory snapshots" or "saved states" for reloading games, etc.? I am aware of Atari800/Atari800Win, supporting this, however the 1 game I am interested in using it for (Spelunker) will not play on that emulator.

5705. Re: Atari 800 emulator supporting "memory snapshots"

Yes it does but not the beta version of the game..

If you use the full version (see in box) then the game works fine.
There are slight changes in the core etc which broke the beta, perhaps
when the new core is ready you will see the beta working again
(perhaps).

Till then play this full version with better sound, a proper intro and
some *very very slight* changes.

Now you can cheat away :-)

5706. Re: Atari 800 emulator supporting "memory snapshots"

Many thanks - works like a charm!

I don't call it "cheating" - simply admiring the full extent of the game design :-)

Why is it after all these years and all my fancy hardware, I still come back to these great 8 bit games? More to the imagination, perhaps?

Message-ID: <3BA2330A.C2C95FB9@mail.uni-mainz.de>
Source record: 34132

Well,
the problem with SIO2PC and Sparta DOS has nothing to do with an ATR image (it accepts all ATR images, no matter what DOS). I meant, that I installed the 480k *.ARC file (which was a PC file, not an image!) into SIO2PC (function I: install PC file as a disk) and tried to write it to an Atari disk. With DOS2 (MyDOS) installed, SIO2PC wrote out the ARC file without any problems, but with Sparta or Bewe installed it could not transfer the ARC file to the Atari...
greetings, Andreas.

P.S.: I do not have a (Null-) modem cable and I also do not have Ape...
Only Sio2PC for the moment.

: Only Sio2PC for the moment.

Don't know about Nick Kennedy's program. It's been a long time I've used it, but with A.P.E. it would probably work o.k. if you use PC-mirror. Since you have an SIO2PC set-up, why don't you try the ATR version from the site? It's much quicker to set-up that way...

I am just curious as to know what "Lou Spear's" actual ebay username is.

is it Loudawg?

i just want to make sure that i NEVER bid on a auction from him.

thank you for putting webpages up like this to warn us about deceitful practices by ebayers.

I agree wholeheartedly. I usually do an "80's retro flashback" every
weekend, putting aside all of the latest and greatest games to use my
$1200 computer to play games like Spelunker, Ali Baba, and Shamus. NO
matter what year it actually is, for a few hours, I can make it feel
like 1985 again.

Cruiser 7

P.S. My Ali Baba and the 40 Thieves Guide should be finished by year's end.

Hello,

I have some old Atari 2600 games up on ebay auction.
Here is the links to it.

Atlantis for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1272211020

Breakout for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273403105

Chopper Command for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273404566

Deamon Attack for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273404911

Combat for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273405222

Cosmic Ark for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273405519

Mouse Trap for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273405941

Riddle Of The Sphinx for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273406442

Seaquest for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273406719

Sky Jinks for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273406978

Spider Fighter for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273407317

Star Wars: The Empire Strikes Back for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273407840

Tennis for Atari 2600
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1273408172

Auction will end on the 15th of September around 4PM.

Thanks for looking,
Michael

Even shopping for games is more 'clinical' these days, I used to walk
into Silica shop in the UK and you were greeted by a wall of sound
from games like Miner 2049er, Star Raiders, Pac man, Tail of the Beta
Lyre and Mr Robot.

Now you walk into a shop and it's like wandering into a record shop,
there's music from some radio station playing or it's pretty quiet
because the demo machine's that are on have the sound turned down to
zero or the pad is removed so you can't even play for a sec.

Ok, it's not very practical to have demo machines running with pads in
these days as you get kids just treating the shop like an arcade but
all it needs is a 555 based timer cut off after say 3 mins of play..

>P.S. My Ali Baba and the 40 Thieves Guide should be finished by year's end.

Nice one..

Thanks for the bloody great binary that isn't allowed in this newsgroup.
As for the ATari bit, it's a well known bit of product placement and also
part of the Bladerunner curse - many of the firms who had product
placement in BR have gone bust.

Well..er.. I've quite a bit since have acquired a 'puter(mentioned
this months ago ina email about emulation :P) and a nice SIO2PC/DD82PC
combi cable recently. Have been enjoying quite a bit of the 8 bit
library, especially the Antic magazine/disks.

5731. Atari Games - Worth???

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-15 22:22:39 UTC
From: Paul Cawley <paul.cawley@cwcom.net>
Message-ID: <vxQo7.2386$An4.47035@news1-hme0>
Source record: 34005

Hi,
I got hold of a some classic 8-Bit Atari disk games yesterday, and was
wondering on their value, as I have little idea of this stuff...

I bought;

Alternate Reality,
Beach Head,
Dropzone,
Tapper,

All complete with case in 10/10 condition (US Gold slipcases with cover),
all instructions and even mail-away leaflets!
Each cost me £9 ($13)!

I can also get hold of the following (unless they sell!)

Archon
Gauntlet,
Gauntlet : Deeper Dungeons,
Mercenary,
Mercenary : Second City,
Solo Flight
Spitfire Ace,
Mr Robot,
Leaderboard

Any worth buying?

Thanks for any info in advance!
Cheers,
Paul

That sucks, and Vidar is a great guy. He's won an auction from me and we
didn't have any trouble. I like his page of scammers though, his page saved
my ass now and again.

Slightly OT but it appears that any seagate scsi drive can be
reformated with 256 byte sectors. Go here and download the enterprize
edition to do it. It runs in the windows GUI.

http://www.seagate.com/support/disc/download/seatools_enterprise_install.exe

Then download the scsi interface manual and learn all about scsi
commands from the inside. Or fiber channel or Atapi or...

http://www.seagate.com/support/kb/disc/index_interfacemanuals.html

5737. When was the final APX catalog?

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-16 05:09:07 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-94BCF7.22083915092001@news.northcoast.com>
Source record: 34010

So I've been working on the Atari Program Exchange Archive (www.atariarchives.org/APX/) and I seem to be missing information about several of the later APX releases. My question is: what was the last APX catalog? The last one I have is fall 1983, with the Get Away! map on the cover. Was there another after that?

See www.atariarchives.org/APX/catalogs/ for pictures of 9 APX catalogs. If anyone has any that aren't represented there, please let me know.

Thanks,

There is really no 'direct' conversion as .EXE and .COM are binary load files, while .ATR is an image of a complete disk or, at least the bootable portion of one.

Ken siders has many utilities for insertion & extraction of all file types and .ATR images for the PC platform.

If you are working on a real Atari 800/XL/XE without an SIO2PC cable, just format a SSSD disk, copy your .EXE/.COM file to it, make a .DCM file with Disk Communicator 3.2, move that file to the PC and convert it back to a disk image on a blank or copy of any expandable .ATR file. voila

There was a great online game called Robowar II that ran on the Carina II
BBS back in about 1987. It was written by Scott Martin and Albert Yarusso.

I have found the file "robo22.arc" off of XLSearch but it has CRC errors.

Does anyone have a working image of this game (preferably in ATR format but
I will take anything)

Thanks,
Chad

Please remove the REMOVETHIS from my email address if you are going to email
me directly.

You can have a New York and a Norway address. Why you don't understand
that, I'll never know.

Vidar is one of the most respected members of the classic gaming
community, whereas nobody's ever heard of you. I do know, however, that
I'll never bid on any of your auctions, and I imagine many others will do
the same.

I won't bid on either of their auctions or ever deal with any of them. Just the selfishness of taking a private dispute to 10+ (!!!) newsgroups -- and doing it very immaturely I might add -- has both of them on my shit list.

I think on some emulators you could load an .exe file like a disk image...
but you should load a "formatted" image (with DOS) on the D1: "drive" and
the .exe (or whatever) file on D2:, then you could copy it to D1:. Repeat
the process and you can copy several files into a disk image.

You are not writing what operating system you are using. If you need it for Windows:

I think, you are searching for a program like this:
http://home.columbus.rr.com/ksiders/atrutil.zip

It converts the files not directly, but it allows you to create a atr file and to insert exe/com files into it.

with best regards
Jarek

I would like to upgrade my atari 800 's RAM (my favorite of the series,
as it seems to have the most quality in it's construction).
I would like to upgrade it up to 4 megs if possible, using whatever is
accecpted as the standard.
(130 XE style swapping?)
I've searched all over the net and have only found dead links..

thanks

>programming project. I would like to write something that would be
>useful to a lot of 8-bit users. Is there something out there that
>would genuinely be useful, but has been just too tough a nut to crack
>for anyone to take the effort?

Why not join Matthias Belitz's ASPI project?
OK, so the BlackBox version is ready, that leaves quite a few other SCSI or IDE interfaces.

CU Mathy van Nisselroy

PS ASPI (advanced SCSI Programming Interface. But it's really software!!) eliminates the need to write all the tools for all the different hardware devices in that it separates hardware specific code from non-hardware specific code. That way, you can use for instance my CD Audio Player utility on a BlackBox with the BlackBox version of ASPI, and on a MIO or KPI or MSC-IDE controller if we had ASPI software it.

Howdy folks

>How about a complete IR-based entertainment center controller?
>Oooops! Sorry. That involves *hard*ware. <G>

Which doesn't have to be a problem, since David Deaven solved that for us.
http://www.execpc.com/~deaven/Dave/Software/irg/index.html

CU Mathy van Nisselroy

PS I'm trying to write a piece of software (involving higher mathematics. Some Mathematician told me to try something) that will minimalize the influence of the slight variation in the signal. (read: each time you press a button on a remote (as in PLAY), the signal might vary a teeny weeny bit).

I actually don't believe that web page. Honestly. He says that he needs $1,500? I've made that much by accident. That ain't no money that a real desperate guy would need. Cripes, $2,000 is walking around money these days. That's gotta be a scam page. If I'm gonna beg, it'll take a HELL of a lot more than a dozen C-notes to make me do it. I don't even TRY to make money, it just comes to me while I do a job I'd do for free anyway. I love electronics, I love communications, and if I get paid for doing what I love, hey, I got direct deposit! I point at something I want, and it's mine, no problem. Easy stuff. I credit a lot of that to being trustworthy. Nobody is gonna get ripped off or screwed by me. That alone makes me well worth my keep. Honesty is worth big bucks. Loucifer (good nickname) hasn't found that out yet. Maybe he never will.

I'm also interested in obtaining a working copy of this, being one of
the authors named above <grin>. Unfortunately, before I went off to
college in 1988 I sold off most of my Atari 8-bit hardware. I'm not
sure what happened to all the software I was using to run Phantasmal
Alchemy. I have some original Carina (I and II) manuals, some
printouts of Carina II source, and some printouts of various ATASCII
login screens (which I need to scan in). But sadly, no Carina II or
RoboWar II disks.

Thanks,

..Al

The atari was a long and steady seller over here. But never a big seller.

Alternate reality and games of its caliber happily go for 15-20£ over here
if complete (and I would pay that much for complete and known working
condition). I dunno about the American Market. It has its problems but role
players like me love it.

Beachhead has its fans, but never grabbed me. It seemed to me as if a number
a poor games were bundled together with a theme.

Dropzone is THE BEST defender clone ever.

Tapper, good version of the Arcade game.

Archon is a good game.recommended.
Mercenary is a classic, though may be an Aquired taste
Gauntlet, a classic in anyones book.
They both would rate as MUST gets (in fact i have both already). and by all
means grab the extra disks (Deeper Dungeons is more levels, 2nd City is the
second whole adventure for Mercanary).
leaderboard was one of the top notch golf games of the time. Proberbly about
the best and most respected golf game on the machine. Certainly recommended
or a Must get if sports sims are your bag.
Solo Flight had good rep as well, Recommended, or must get if Flight Sims
are your interest. Microsofts Flight Sim 2 is generaly considered its main
rival amongs flight sim fans on the atari.
Mr Robot if its like the game of that name I have is a so-so platformer. Not
worth putting your self out to get

Price? if you want it, you can afford it, go for it!

I was recently contacted by a filmmaker who requested my footage for use in a documentary. Getting back to work today after last week's horrible tragedy, I realized that her address is in downtown New York City.

MapQuest puts her office at *one block south* of the World Trade Center.

I am not able to reach her by phone, so I sent an e-mail asking if she is all right.

Please keep her, and everyone else who has been affected by this tragedy, in your thoughts and hearts. Thank you.

Source record: 34041

Most of the 800 upgrades I had seen used the Axlon type bank switching and stopped at 1088K; Axlon used an address in that 4K area $C000-CFFF rather than PortB like the XL/XE mods. I have a 128 board, but no docs; not sure if joystick ports 3 & 4 present a hardware obstacle to using PortB with the 800 memory mods.

I'd like to know that too, when I last spoke to Derek some 2 years ago he was in the process of changing ISPs and was talking about launching a web site for Micro Discount.

However, AFAIK the website never materialised and I've since lost both his 'phone number and email addy. :-(

BTW I used to bump into him frequently at local radio rallies, but haven't seen him at one for at least 2.5 years.

Dear Atari fans,

I have long been the owner of an Atari Portfolio (and am still happy to use it in these days of Pentium 3 CPUs).

I have an instruction manual about upgrading the RAM to 512 K but it doesn't state what the part number of the chips to be used is.

If anyone has done the upgrade successfulla, please could you let me know the part number needed.

TIA

Abdullah

Source record: 34050

Not good at understanding schematics.
R39 on line RST SW is 56k resistor to 5v. attaches to pin 6
of U19 (U19 RESET). Pin 40 of CPU goes to pin 3 of
this U19. There's 5v to pins 4 and 8. Pin 2 is R200 (470k) then
to grnd. Pins 6 and 2 are connected together. there's a C200 cap
(.1 (mf?)) cap then R40 (100 ohm) to RST SW and the R39 to
5v.
Well. I'm looking at the Sam's Computerfacts schematic for 130XE.
Russ

5776. xf551 questions

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-18 13:26:20 UTC
From: bo snyder <bobo_snyder@hotmail.com>
Message-ID: <B7CC998C.F72B%bobo_snyder@hotmail.com>
Source record: 34048

hi everyone,

i got a while back a working xf551 for a song and was wondering if this upgrade was possible:

i found at a used computer store for a few bucks one of those combo 5 1/4 and 3 1/2 inch drives. you know the kind that have both the 5 1/4 and the 3 1/2 drive in the same half height bay.

i would LOVE to use this drive in place of the single 5 1/4 inch floppy that exists in my xf551 now.

the type of connector it has on the back of it is a single 34 pin header connector (the same type of connector as a normal 3 1/2 inch floppy driv3e would have) and i am assuming that the cable that connects the 3 1/2 drive to the 5 1/4 drive has a built in twist like a normal pc floppy cable.

does anyone know if i can use this drive in my xf551? i dont' mind "customizing" the combo drive such as tearing into it and doing whatever to it.

also the max capacity kilobytes-wise of the 2 drives isn't as important to me as acutally being able to use the combo drive as 2 separate drives on my atari or should i use some sort of a switch?

thanks
bo

5777. HELP! Alternate Reality!

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-18 13:45:44 UTC
From: Paul Cawley <paul.cawley@cwcom.net>
Message-ID: <1flp7.15738$Bp3.223328@news2-hme0>
Source record: 34049

Help!
Last week I got hold of some classic original Atari games, one of them was Alternate Reality - a game I have never played on 8-Bit before...
Typically of all the games I got, the one that does not work is Alternate Reality!

Any idea if this is right...
I tested on both my 800XL and 130XE, with an 810 drive (option pressed and not!)...
The first disk loads OK, I get the intro, and choose a temp player, then walk through the 'portal' and it loads side two of disk one.
I the get a screen which asks me to put in disk 2 side one, this is OK for the first couple of seconds, then it starts to flash a little green and white blocky garbage in the middle of the screen, on and off while the 'pips' of the loading are going, this I have left for 5+ mins, to no avail...

Is it busted?
I booted disk 2 itself, and got a copy program, that scanned up to asking for a destination disk with no problems - what is going on?!

My questions,

1) How long should it take to load after putting in disk 2, side 1?
2) Could anyone do me a backup of both sides of an original disk 2 on a new 51/4" disk (The manual states this should be done, and is achieved by booting disk 2 into the copy program, so it should be relatively easy for someone with an Atari and a original version of the game to do!)
I will obviously pay for the disk, your time and postage, I really want to get this working!

Pease help me out on this one!
Paul

You would probably have trouble. I'm 90% sure it is a 1.2 meg 5.25" and 1.4 meg 3.5". AFAIK, no way to get these to work with an upgrade. Maybe it could be done, something like the Ajax chip with the ST drive, just never heard of anyone that got it working.

A 720k 3.5" mechanism with a new ROM is the path of least resistance. It gives significant storage improvement and the 3.5" disks are convienent to use.

Do you get a "Press START..." or "Insert disk 2.1"? The routines for loading
the game and copy protection are buggy as hell, very poor execution.
Sometimes I would have to lean on the START button for 5-10 minutes to get
the game to load when the routines would fail.

Disk 2.1 is *not* copy protected in any way. If you have an SIO2PC cable,
you should be able to get an image off the net.

i heard that if you used 1.2 meg or 1.4 meg floppys in the xf551 without any major upgrades, you would only get like 360k out of each of the drives. i am not totally sure, just wondering.

i don't mind upgrading my xf551, i am just not sure which upgrades i would need.

thanks

I was working with my Instant TV today and made a discovery that is probably worth posting. Several people have commented (including me) that the Jam!! and Instant TV make a wonderful display on a VGA Monitor, but the display tends to be somewhat small, taking up only maybe 2/3 of the normal PC display. I concluded that it was because of the low horizontal frequency resulting from doubling the Atari composite output (relative to a typical VGA output). Perhaps that's wrong. At any rate, I was trying to get my satellite channels to output on the Instant TV and was adjusting the actual monitor controls. Amazingly, I adjusted the picture size and placement of the Instant TV output (Atari), and I was able to fill the VGA screen. Then I thought that the PC display would be messed up. Not so! The PC display was unaffected, and now the Atari display was about 50% larger. It's going to take a little getting used to. Looks just as good, but bigger!

The stock ROM only has routines for 40 tracks, so if you get any drive with
more then 40, i.e. 720k or 1.4 meg 3.5", 720k<quad density> 1.2 meg 5.25",
you are only going to be able to format the first 40 tracks.

As I recall, those 2 in 1 drives actually tried to look like IBM drive A<1
jumpered twisted cable> and B<1 jumpered straight through cable>. This
doesn't work in a 551. I think it only recognizes drive 0.

I did this with a Epron combo 5.25"/3.5" drive and it worked
good, but the Epson had a card edge connector. If you use the proper
adapter you should have no problem interfacing the drive.

Upgrade the rom in the XF551 so it can use 80 track drives.
Someone was nice enough to post the rom changes to this group some
time ago, so you should be able to find them in the archive.

After thats done just drill a hole and use a external switch to
change between drives, with the swtich wired to the jumper poles.

If you want to use both drives at the same time you will probably
need to do some custom work on the drive OS so it will respond to both
drive numbers and control the drive select input with one of the
XF551's IO outputs instead of a manual switch.

It would also need to store 2 copies of all the configuration
information, one for each drive.

If the replacement 5.25" mech is 80 tracks you wont be able to
read or write 40 track disks unless you program the rom to double-step
when configured for 40 tracks, or perhaps if the drive has a jumper for
double-stepping.

Interesting side note:

Dave Ewens was not only a member of Tyne and Wear. He was also a
corresponding member of the Ol' Hackers during the time that Alex Pignato
was alive and president.

Alex had this thing about reading every piece of correspondence at meetings
along with his replies. It took up a lot of time at meetings and annoyed
some of the local members, but we all enjoyed hearing from and about Dave.

I miss those times.

make sure your drives are both set to read and write. Also make sure you
have backedup these files because I'm fairly certain this game writes to the
master disk to keep up stats. It also makes use of an optional map disk
(blank formatted) to save your game on and I think it does all of this with
one drive. I have the cover and instructions, perhaps when I have time I'll
post them to my little webpage.....

I think you insert the B side of the disk if you haven't made your own personal map disk. Tell you what, I'm going to scan the instructions now. They're for the C64 version though but still easy to relate to the Atari, enough to give you the general idea. These games are so much more fun when you know what to do aren't they? Try my link in about a half hour to an hour and it should be up at the top of the page. I'm never inconvenienced by a good game!

Okay it's up now- a few lines down from the title of the page. There is a bigger manual also, it's not much more help than the little one. Basically just historical background to give the game more substance (fluff). When I have more time, I'll scan it as well. Just a note from the big manual-

-food is bought or bartered for in relation to the number of men you plan on. Gather your men first, then get food- same goes for when landing a search party or whatever they call it.

-when moving use the joystick for direction, pressing the button at a stop produces a menu, pressing it while moving sets speed (cruise control)

-Use the pub to save your game

-go home for your stats

-go to the court to beg for money

-trade with the villagers for safety

-play with the joystick in the transfer menus to figure it out, it didn't take me too long to get the hang of it

-map disks-
BOOT SIDE 2 of your program disk (side B ATR) for the historical scenario- this is the one I always used
BOOT SIDE 1 for random world - this takes way too long!!!

Hope this helps, I can't test it right now- my roomate won't get off the TV!

At least half a year ago I scanned the Atari manual of 7 cities and,
together with several other scanned manuals, sent it on a CD to
Aaron Wheeler. So maybe there is an easier way to get it than to
scan it again. I'd email it to you but emails with several mb of
attachments are a problem for me. BTW, I only scanned things in
greyscale, not color.

Gerhard

I am looking for anyone who knows where I can purchase Memotech hardware and software, including disk drives and publications relating to the Memotech. Sorry as this isn't related to the newsgroup, but there is no group for the Memotech. Also, as some have more than one 8 bit system at home, if anyone knows of a source for the Timex FDD 3000 disk drive / interface, please let me know. I would pay very well for these.items.

Thanks

Kurt

Hi, Mo;

Not completely certain what you are seeking... A copy of DiskMend is on my site; it is Basic with some USR(calls to read sector data and includes a disassembler for machine language.

--
-Ron

Experience is something you don't get until just after you need it.

Yeah, thinking about it- I was pretty tired when I made that last post. I think I just need the edtasm cart and manual, If I can find those things I'll be okay. I'm trying to reverse engineer 'The Curse of Ra' so I can make a disk version of it. It's actually an expansion module for 'Hellfire Warrior'. There's a tiny machine code portion that reads and loads the data file off of the tape. And looking at the disk version, the data file for that seems to be in machine code as near as I can make out.

When it starts the data loading process it goes something like this-

open #3,4,128,"c" --opens channel 3 for a read in short intervals from the tape

poke 764,12 fakes a keyboard press to start recorder
poke 881,0 I think it's zeroing the cassette buffer with this one
and then
I=usr(ADR("hhuhthyhxhhr"0LVD"),26672,1024,7)
That's whats killing me right there, could that be a ROM call?
Also a couple of lines down there is this:

B$="h)pt>>/> P} tPz)/{}y}} etc.etc. I can't type any more of that....

x=USR(1564,ADR(B$),30208,LEN(B$))

These are line numbers 350-362 in the cassette version of the innkeeper program of Hellfire warrior. If you have this program, could you please explain how it loads the data file from the expansion module tape? Even better, tell me how I could transfer it to disk- all I'd need to do then is name the data files after the hellfire data files and it could read them that way without any more tampering.
In case you didn't know how this game works, you load the innkeeper first and setup your character- then you load the dunjon level of your choice (data file, either hellfire or curse of ra), then you load the dunjonmaster which executes the game.
I wanted to be able to create a disk version of this one in particular (curse of Ra) because I have not seen it in any of the 8bit archives. It's not to be confused with the more modern mahjong type game with the same name.

Wasn't that an aftermarket supplier for the Timex/Sinclair computers?
I would try the comp.sys.sinclair newsgroup or even the comp.sys.cbm group
if you don't mind starting another computer war. 8-)

Thanks for the offer, big emails are a problem for me as well right now what with everyone in my family sending me pictures of eagles and flags. Sorry, I don't mean to sound uncaring- it's just an act of terrorism having to wait ten minutes for my email to download every day. I'm not sure what would be more trouble- me scanning it or you mailing a copy. I'll probably just scan it, eventually I'm gonna have to redo that entire homepage. It's starting to look like a bargin bin at the local library book sale. Thanks again, Mo.

With all these 'can you help me find?' questions i feel it would be nice if peeps told us at least which continent they are on.

I did spot some stuff at a shop in London with a web site.

Here is the URL:-
http://members.aol.com/retrox2/index1.html

It may not be listed on the site.

Poke 881 is to the ICDNO Device number for IOCB #3; puzzling why set to
zero...

> I=usr(ADR("hhuhthyhxhhr"0LVD"),26672,1024,7)
We need the full atascii to disassemble this; DiskMend can do it right out
of the LISTed or SAVEd Basic files. There must be some inverse or control
codes in there because it is invalid as printed...
h = PLA ; how many parameters passed
h = PLA ; hi byte 1st ", =26672/256 = 104
uh = ADC $68,X
t = ??? not valid opcode
h = PLA
yhx = ADC $7868,Y
r = ??? invalid opcode
LVd = JMP $E456 (CIOV) when 'd' is inverse; it saves one byte over JSR
$E456, RTS. The RTS from CIO can send you straight back to Basic; there is
no real need to RTS back to the USR(call and then immediately RTS to Basic.
If you can get the tape data into a disk file, you should be able to Open
#3,4,0,"D:HFWARIOR.DAT", work the appropriate USR(magic and continue on
unless there is a memory conflict with DOS now occupying $700-1CFC or more.

> x=USR(1564,ADR(B$),30208,LEN(B$))
With this, you have to know what is in page 6; data statements?

Since the function passes 3 parameters that narrows it just a bit. I mean
the first h/PLA has to be the number of arguments and the next 6 are getting
the 3 parameters.
> h = PLA ; how many parameters passed
> h = PLA ; hi byte 1st ", =26672/256 = 104
> uh = ADC $68,X

Probably something like
u with u a munged => TAX or TAY
h with another PLA
> t = ??? not valid opcode

Got to be a TAX or TAY or something to store the parameter.
> h = PLA
> yhx = ADC $7868,Y
> r = ??? invalid opcode
> LVd = JMP $E456 (CIOV) when 'd' is inverse; it saves one byte over JSR

That pretty much tells all. The parameters passed are most likely buffer
address, buffer length, and command or IOCB<?>. I can't remember what 7
would mean. Maybe IOCB 7 is left open by basic or something.

> $E456, RTS. The RTS from CIO can send you straight back to Basic; there is

Well looking at the printout of just the innkeeper portion of the game,
either the author was extremely sloppy (making an absurd use of unnecessary
variables and goto's) or it was an efficient program that was
overcomplicated on purpose to defeat any copycats. The game itself is not
copyprotected but I could definitely see someone re-using the engine to
build their own game on.
I tend to get kind of lost when talking about machine language, I can crank
out a pretty good BASIC program though. I might blow this off and just make
a good CAS file of 'The curse of Ra' to circulate.
Thanks,
Mo

I think to really simplify the problem, all I would need to do is copy the
data file from tape to disk. And then like you say, rename the file to
"D:hellfire.x" the problem I'm having is transfering it from tape to disk,
is there some kind of utility that would do this with a data file?
Thanx
Mo

Bet on the former. You actually can write clear and efficient code in BASIC
if you have some training and discipline. It's easy and common to write bad
code, AMIS is a good example. I did see a good BBS written entirely in BASIC
but it never recieved popular distribution. The author used standard
techniques like printing long strings to the serial device vs using the
slower put/get byte routines. Thing was really a work of art as far as 'how
to write clear efficient BASIC'
> The game itself is not

crank

Just think of machine language as only having 3 variables, A, X, Y, and 64k
memory locations.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Yes they did! I actually got my first 800 and all the software for it at Sears. Back then in Galveston, TX there were no software stores other than radio shack so I frequented BDaltons bookstore for the latest titles from Epyx and avalon Hill.

CopyCass would do it, but with only 1024 bytes the low impact way is to let
line 34? load it into memory at 26672 and then move from RAM to disk with:
Open #3,8,0,"D:HFWARIOR.DAT:For L=0 TO 1023:PUT #3,PEEK(26672+L):Next
L:Close #3

You could also Poke the necessary stuff into IOCB #3 and use the
X=USR(ADR("hhh*LVd"),48) where the '*' and 'd' are inverse.

Technically, sort of, it is a call to the 6502 machine code stored in that
string of characters in RAM which then jumps to the Central Input/Output
Vector for transferring bytes. The vector and its routine are in the ROM OS
of the Atari.

> >> x=USR(1564,ADR(B$),30208,LEN(B$))

This might be moving the contents of B$ into RAM at 30208 which is an even
page break; PM stuff?

The LvD is certainly a $E456 CIO call I think.

> These are line numbers 350-362 in the cassette version of the innkeeper
> program of Hellfire warrior. If you have this program, could you please

You've got some BASIC program called 'innkeeper'.
What follows seems to indicate that inkeeper sets up the character
then loads the dungeon. Then you load dunjeonmaster to play the
game.

> In case you didn't know how this game works, you load the innkeeper first

Have you sent Ron or Rick the 'innkeeper' loader program? They could
tell you what it is doing.

If you want to send me the BASIC program, I'll look at it.

I still am not sure how this game works.

Not! PMbase requires a 4K boundary. Probably just data for the level; the
1024 bytes at 26672 are likely a redesigned character set...

Hey everyone-

Does anyone know if the following games were released for the 800XL (on disk or cart):

-Tapper
-Indiana Jones & the Temple of Doom
-PaperBoy
-Rampage

I know these are some of the most popular VCS/coin-op titles, but I can't find them for the 8-bit computers.

Thanks!

Exactly, it does use a new character set and it loads it at the beginning of the program which is where I spotted these lines of code, right after the title screen and before the 'innkeeper' actually comes up. That was something I overlooked and would definitely be necessary for the disk version. I found the CIOV routine while flipping through an extremely ragged copy of 'mapping the atari'. It gave me just enough information to get me really frustrated. I can see how the routine works to start a load, but how do I tell it where in memory to store it and how do I tell it to put it on disk? Forgive me for being such a newbie, until now I never had a use for any vectors.
I'll make a copy of the program without the data files on an ATR and email it to you if you want. Thanks, Mo.

Yes they did. My wife, some neighbors and I used to play "Oil Wells"
that was released under the Sears label. I have no idea who actually
wrote it (BTW, it was in Basic and on cassette tape!).

(1050 not working)
By not working, you mean the power LED doesn't come on when
you turn the switch on.
That indicates a power supply problem, I would think.
I don't really understand the thing about not plug/unplug the SIO with
the transformer plugged in (it doesn't matter if the computer is on
says Rich Meir in the A8FAQ). I'd turn off the computer for SIO
plug/unplug, but Meir says also unplug the power adapter from the 1050.
Time for a SIO2PC/APE cable.

Today, I had the urge for a bit of nostalgia, so I decided to get my old 800XL out of storage, along with its US Doubler equipped 1050 floppy drive.

Connected it all up and switched on - It still works - So far so good. But after running the self test, when I go to put a disk in the drive, I notice that the drive, which did switch on before, is now not working.

I then notice that the data cable has fallen out. Now it's widely known than you don't remove a cable while the computer is on, so could this be why it's just gone belly up?

I've checked the power supply, and checked if power is getting into it, and everything checks out - It's just dead.

So, any suggestions guys? Any idea what the most likely thing to have blown?

Hey all.

Has anyone seen or know anything about those coin-op machines that do the matchmaker thing? I know you enter in name age, etc for two people and tell you how compatible you are to each other, and who you two would be compatible with such as movie stars, etc...

I know it is a Atari 800XL with a custom ROM Cartridge, printer, and 800XL keyboard with some of the keys covered up with paint. Blue, Red, etc...

Does anyone have the ROMS to use in an emulator like Atari800Win?

Or have information on who designed this unit? etc...

Thanks!

>>years ago he was in the process of changing ISPs and was talking
>>about launching a web site for Micro Discount.

> Well, he did have a web site (think he was with Demon Internet) but
>it wasn't much to look at....

I don't recall where he said he was setting up the new website, but I'm
pretty sure he didn't mention Demon. Perhaps this was his original site?

>....Last I heard from Derek was not long after Dave Ewens of Tyne &
>Wear Atari User Group passed away....

Hadn't heard about that, when did he pass away?

> Derek was interested in publishing a program I was working on at
>the time....

Likewise, I'd been tinkering with some ideas for games (I used to work in
that field) and he was keen to see what I'd come up with. Derek has always
been a big source of encouragement to Atari developers - he was a very
enthusiastic member of BUG back in the 80's (I think it was down to him that
the club continued to operate well into the 90's).

> A few weeks ago I dug out an emulator for the PC and Mac/65. It
>was just like riding a bicycle again....

Actually, that's why I'm here again....decided to have a bash at 6502 again.
Been looking for tools which run under Win2k - got an emulator and assembler
but the disassembler is proving problematical.

My favourite, DIS6502, appears to have issues with the NTFS file system.
:-(It works, but....

Oh, any idea where I can find some ROM images of Atari carts in ".BIN"
format? I've tried many of the usual sites but they all seem to have them in
".ATR" format. :-(

TTFN - Pete.

Thanks Russ, that's the 800XL version in machine language. The one I'm seeking (and not finding) is 'The Curse of Ra' written in BASIC for the 800/400 computers. It has an entirely different look although game play is essentially the same. I've sent you an ATR of the innkeeper and dunjonmaster from the cassette version of 'Temple of Asphai' which loads the data from the curse tape. If anyone else wants to help me on this let me know and I'll fill you in. Thanks, Mo.

>I did this with a Epron combo 5.25"/3.5" drive and it worked good...<

Hi Steve-
There should be a couple of other issues with this type of modification, and I wonder what your experiences were.

All combo drives are 1.2 MB high density drives in the 5-1/4" portion. HD 5-1/4" drives are designed to spin at 360 rpm (not 300). In a PC, even when a HD 5-1/4" drive is reading or writing a DD disk, it still spins at 360 rpm. When you did this mod, was this an issue? Perhaps the 551 board electronics automatically spins it at 300 (and then electically compensates down to be equivalent to 288)? All 3-1/2" drives are designed to spin at 300 -- from 720K to 2.88 MB units.

Second, the R/W and erase heads are too narrow as compared to a 360K DD drive. So if you mix erasing and writing with disks created with a regular SD/DD type drive, the tracks should get messed up, even if you double step to get a "40 track" drive. If you never mix disks, this wouldn't be an issue.

Third, what kind of disks would one use? The R/W heads are really designed for HD disks, and those are significantly different than DD disks. Did you use regular or HD disks?

Larry

I selected the Epson units I used because they include a jumper
for 300 RPM operation on the 5.25" drive. I no longer have the drives
in question but I have the Epson data sheet, the model number is
SD-800/SD-880.

They are really expensive to purchase new. I got a few off eBay
for $5 or so each, a steal really considering how easy they were to
install.

> Second, the R/W and erase heads are too narrow as compared to a 360K DD drive.
> So if you mix erasing and writing with disks created with a regular SD/DD type

The 5.25" drive on the epson is an 80 track drive, so it would
never read or write a disk made in a 1050 or stock XF551. With a
double-stepping mod to the rom it would happily read 1050 disks, in fact
it would read track 0 always, but i didnt perform this particular mod.

> Third, what kind of disks would one use? The R/W heads are really designed for
> HD disks, and those are significantly different than DD disks. Did you use
> regular or HD disks?

I dont recall having any problems formatting DS/DD disks in the
drive, even at 80 tracks. The disks were real blank disks of course,
not previously formatted in the Atari.

The 3.5" drive operated fine on DS/DD disks as well, 720k per disk
in double density/80 tracks/double sided mode.

Tapper and Rampage were both out on disk

Tapper was proudly badged as Sega, Rampage I think was an Activision game
(or converted by them) and most playable.

Never saw the other two on the 8 bit. But we didn't get eveything here in
the UK.

I've loaded the games from disk versions of carts
into A800Win, gone into the debugger and saved the
memory to a file. You can then use Attach Cart Image.

Didn't work for all of them (?) but quite a few ;-)

I was thinking about this to recently (OCR book to atari), As I dont have an
atari no more ,any chance one of the emulators could cut-n-paste into basic
or any other ideas to OCR & transfer to an atari image basic file?

>
> --Charles

Oil's Well was a Sierra On-Line title. At least by 1983 it was. Don't know if it had some prior history with a small company. I remember the local Sears having a lot of APX titles and buying "Eastern Front" there. Don't remember any Sears brand 800 stuff. It would be interesting to locate an old catalogue.

It did to start with, and I heard the head move (as it does when you first switch on), but a few minutes later, the LED was out and the drive was dead!

> That indicates a power supply problem, I would think.

But not the external power supply, because I've checked that with a multimeter. It has to be something internal. Also, the heatsink is warming up, so power must be getting in there - It's just not doing anything with it.

Hit me if you will.. But as I was writing a paper on various simulators / games, I remembered how much I played SCRAM until my floppy disk drive died on my Atari 800xl (that happened about 6 years ago). I was motivated to go and find an emulator, rom, etc and the game as an .atr file, but in my lack of using an Atari in so long, i found that i have totally forgotten how to do anything except program in basic from the "ready" prompt. Can anyone help me / poke me at some sort of document telling me how to load a game (using xformer 2000 and the documentation did not say anything at all about loading games, i tried putting the game as teh second disk drive but then could not figure out how to access it).

Many thanks to any one who does not merely dismiss me as a stupid teenage girl (i'm not! i have my ccna, a+ and mcse2000 and have only forgotten how to use Atari due to lack of use)

Hi,

> HD 5-1/4" drives are designed to spin at 360 rpm (not 300). In a PC,
>even when a HD 5-1/4" drive is reading or writing a DD disk, it still
>spins at 360 rpm....

There are actually dual speed 1.2Mb drives, these switch between 300 and 360 RPM depending on the density setting. All 1.2Mb drives have this line on the connector, but on the more common single speed drives it only alters the write current.

Teac used to make dual speed 1.2Mb drives (I have a couple), but they are a *LOT* less common than single speed units - they required "special" (read "more expensive") floppy controllers so never really took off in PC circles.

> Third, what kind of disks would one use? The R/W heads are really
>designed for HD disks, and those are significantly different than DD
>disks....

Use ordinary 360K (DD) disks - as long as you set the density select line (/DEN?) correctly!

In practice all you need to worry about is that HD discs require a higher write current than DD ones. If you don't lower the write current when writing to DD discs the signal recorded on the disc could be distorted making it difficult, or impossible, to recover.

TTFN - Pete.

Wayne.
Uhm, hope Rick Cortese or maybe Bob Klass or one of the other
electronics people picks up here.
I think there's a bridge rectifier in most A8 hardware. It is like
4 diodes in a circle (really not too swift on this stuff). If you open
up the drive and check some voltages around the entry of the
9v AC, you may find something interesting, like a diode that's open
or shorted, I'd guess open, nothing goes either way.
Since the power LED doesn't come on, it sounds like something
very near to the 9v input (I think I said that).
Maybe some hardware type could make a 'howto' or something
about 1050s. The problem with that is the 1050, like most A8 stuff
is a little complicated for the uninitiated.
Just rambling. Good luck.

A complete system with console, 1050 Disc Drive, both power supplies, data cable, DOS 2.5 diskette, RF switch with correct cable, manuals for computer, disc drive and DOS. Basic, Pac-Man and Missile Command carts with joystick makes a Plug 'n Play system!
Condition is Excellent. Works as new. Looks great but there are a few scratches on the top of the disc drive trim.

Source record: 33981

It was one of their type-ins, and I typed it in. Anyway, I'm trying to find it for an emulator.

You were piloting a lander craft, over an 8x8 or so grid. There was a small red dot in one square, you piloted over that one and dropped down to another 8x8 grid level, piloted to the red dot, and then dropped down to the final 8x8 grid level, with radiation volcanoes to avoid, and some other stuff (I think). Your radiation level, fuel, etc were arrayed along the right side of the screen. The ground was green grid, green radiation volcanoes, green everything.

Anyone else remember it and know where to get it? Besides the 200 or so disks in the other room, with the inactive 800xl? ;vD

I forgot, if it's not a basic game- make sure you 'remove' the basic
cartridge for the 400/800 or hold down 'option' for the 800XL. If you're not
sure try both until you figure it out.

I would suspect the regulator at Q7 (7805, a cheap part). Turn
the power switch to the ON position even though the light does not come
on, and measure the voltage between pin 3 of this regulator and the
large aluminum heatsink its attached to.

```
-----------------
------- X -------
------- X -------
-----------------
0000000000000000
0000000000000000
0000000000000000
00000 7805 000000
0000000000000000
0000000000000000
0000000000000000
| | |
| | |
| | |
1 2 3
```

This should be about 5V probably a little lower 4.8 or 4.9.
If its zero, check the voltage between pin 1 and the heatsink, this
should be well over 5V.

If there is voltage on pin 1, but not pin 3 then the regulator has failed, just replace it. You can get a 7805/7905 at any Radio Shack store. If there is no voltage on pin 1 then the problem is before the regulator.

Make sure the large electrolytic caps in the power section are not loose, and that none of the 6 rectifier type diodes in the drive have failed.

Steve

5860. SIO2PC

You say you have the game, tried to load it from D2: in
xformer 2000. You get the READY prompt, so you have
BASIC ROM installed correctly. If you are booting from
some .atr (no I think xformers uses xfds), anyway to get
to the DUP. menu you type 'DOS' from READY. Then
you can look at what's on D2: with 'A' and 'D2:*.*'.
Uhm. I think you may have a BASIC version of SCRAM.
If so from the READY prompt you'd type 'RUN "D2:SCRAM.BAS"
or something like that (no leading '). You can just load the
BAS file with LOAD "D2:SCRAM.BAS.
There's a BASIC tutorial by Bill Kendrick someplace. Look in
the A8FAQ, the location to find is mentioned in the CSA8 Welcome
to comp.sys.atari.8bit, by Michael Current.

hi there,

i would think that it would be best if you could make one. i bet you could order most of the parts online from a electronics dealer and order the sio cable from someone like best electronics who takes credit cards.

it would be probably cheaper to do it that way anyway.

5865. Atari Hacking/Phreaking Programs??

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-25 17:25:06 UTC
From: admin@straylighttech.com
Message-ID: <b2d16e47.0109250925.544ccae9@posting.google.com>
Source record: 33989

I have already posted one message searching for Atari BBS software for a public archive I am putting up.

This archive will also have programs related to computer hacking and telephone phreaking for all platforms. The reason for this collection is purely nostalgic, and because I have come across many people who are searching for these types of programs for odd machines.

I realize that most of the programs do not work - which really isnt even a concern. I also realize that some of you may think that a compilation of such software is not worth spending time on - which I am also not really concerned with. I used this software nearly 20 years ago, and unfortunately lost my Atari software collection. I would like to rebuild it, and also put in online, along with the BBS Archives, and make them available for people interested in all retro computers.

If you can help, I would appreciate your response. My email address is admin@straylighttech.com, I will also be checking this board frequently.

I found that it don't work at all on my Hades060.
But seriously it is slow on a TT if you can find the special
cache disabled version. It never was pollished or in my opinion
finished to where I'd call it useable. I like Draco's EmuXL
which is fairly quick, runs on my Hades060 even with MiNT,
however it's still in development.

I used it, even had the cable for putting an 8 bit drive on the ST printer port. The emulation was less then perfect, not enough horse power in an 8 MHz ST to get it done. It works for things like light programming in BASIC or games that don't push the limits of the original system.

As far as i know (i havn't done it but a pal of mine did something similar)
you can do this.
Of course just copying and pasting the code into basic will not do it, as in
some cases you might need the actual sprite files (but most often the sprite
data would have been coded into all that code your pasting).

I'll have some code available on a web site thats in development by the end
of november. I'll post the link if anyone is interested then.

It is all in the Input/Output Control Block (IOCB); there are 8 - all the
same, starting with #0 at 832 ($340). IOCB #3 happens to start at 880,
making offsets easy to follow in decimal:
881 is device number
882 is the command - open, read, write, close
884,5 is the address - of device name or buffer
888,9 is the byte count to send/receive
890 is auxillary byte #1 - 4=read in, 8=write out...
891 is auxillary #2 - 128=C: short IRG...
see Mapping pg 85 after address 944

It is a snap... clean up the OCR scan in WordPad or any editor you can search and replace ones for lower case L's or upper case I's and zeros for upper case O's.

Next use Ken Siders Atari Utility for Windows to insert the file into an .ATR image and ENTER it into A8 Basic on your emulator. If you did a fair cleanup job, you will have only a few error lines displayed. If you have more than one screen full, then LIST it out to a file, and bring it up in TextPro to search for 'ERR' and fix the lines. After you have it checked by DCheck or Typo you can SAVE the code to a tokenized file.

The XDM121 is a direct connect daisy wheel for any Atari 400/800/XL/XE; it
does not require a parallel interface adapter. Seems like the Okimate 10 had
a model for the Atari 8 series and maybe Axiom did too.

Any Centronics parallel type printer functions with the interface modules.

Yeah I have an Okimate 10 (or two or three), they were clever in that they made one printer and seperate interface cartridges (for the printer) that would connect it to just about every computer built 'in the day'. Unfortunately the Atari interface for it is shot and I'm back on my trusty 1025, which is my favorite because of the typewriter ribbon thats cheap and easy to find as well as an easy paper load. The Okimate gives me a headache every time I try to load it's paper! Talk about close tolerances (tiny paper slot).

ST Xformer seems to work at about real speed on the ST but it does
not include PM Graphics emulation and it has lots of dirty hacks
in it to enhance performance. That's the reason why it doesn't
work on 68030 and later processors except maybe with caches turned
off.
There is another, complete, XL emulation under development for the
ST but although the guy who's working on it is very competent and
working hard for half a year I think, I doubt that he could ever
achieve anything near to real XL speed on the ST.
I am working on a 68030+ version of the Atari800 emulator and at
the moment have it running at about 1/4 of original speed on a
CT2B Falcon.

Gerhard

Because it IS supposed to be green. High quality monitors don't artifact, so
hook your 800XL up to a TV set. :)

Or try the game on an emulator with artifacting enabled.

Hi all,

I've recently picked up a 7800 console and a few carts to go with it. Unfortunately the power supply was not included, and I was wondering if anyone could suggest where I could get an alternate one (for an Australian system), or wether it is possible to make a power input connector to use a regular multi-voltage power supply instead?

Any info would be a great help, TIA.

Will

Well,
there was an Epyx game called "Indiana Jones" (do not know its full
name). Today, you can find this game in many PD archives under the name
"Beneath the Pyramids". there is also a Pd game called "The adventures
of Dr. Jones". Thats all I know about it. Tapper was from Sega, Rampage
from Activision; Paperboy (allthough from Atari Games or Tengen) not
avaiable for the 8bit Ataris... -andreas.

Message-ID: <3BB1E00C.CFC7B3AF@mail.uni-mainz.de>
Source record: 33914

Well
besides Atari, there were quite many companies (to many to name them
all!) that produced such 7,8,9 or 24 pin printers. Some of them even
sold them with SIO cable (instead of standard printer cable). From Atari
I also know the following 8-bit printers: 820, 825, 1029, XMM 801 and
XDM 301 (not sure about the XDM printer). -Andreas.

Well,
all VCS and 800/XL/XE machines are 8bit machines. ST is an abbreviation
for sixteen/thirtytwo (16/32), meaning they were 16 bit computers, but
had something that was 32bit (Maybe the parallel bus ??? Something on
the XL parallel bus is 16 bit I have heard...) -Andreas.

P.S.: Were there ever any 1, 2 or 4-bit computers ??? And were they
really called computers ???

Well,
there is the XL Deejay, which merely emulates the floppy (just like
SIO2PC or Ape). But it uses its very own .DI format which is not
compatible in any way to ATR, XFD or DCM. Even Jindrich`s ACVT convert
program does not convert properly to those .DI images (it converts, but
the Deejay does not accept them).
So, the XL Deejay is a pretty well program, but only if you do not want
to swap images with your friends... -Andreas.

Intel 4004 CPUs were used in early computers, so I guess they would
count!

I seem to recall the VCS running at about 1 MHz, something like 3.79MHz/(3
or 4).

Sort of. IIRC, the early HP programmable calculators were 4 bit CMOS micros.
There was also 4 bit micros that someone took and wired together to make an
early computer that could handle data 16 bits at a time.

There were probably a lot of early PDA type devices that were built on less
then 8 bit processors too.

I think Motorola still makes a 1 bit micro. Not a real complicated thing, it
would tax its capabilities to do something like detect coin drops in a
vending machine. Definately more microcontroller then computer.
!

Heeeey, I need some bugreport in order to make you (and DeeJay) happy!
;-)
So, tell me which images got converted and don't work on DeeJay. Are you
sure you have the latest version?

I tested it this way: DI -> ATR -> DI and compared source and dest DI
files.
I didn't find any which was different.

> the regulator.

Thanks for replying.

This was indeed the case - The regulator was showing nothing on pin 3,
but about 10v (too high?) on pin 1. So I replaced it. Unfortunately,
it still doesn't work, and this new regulator is exhibiting the same
'fault' as the old one.

Now, in the process of putting this new regulator in, I may have had to
use the soldering iron a little more than I would have liked to get pin
2 to connect on the not so easy to get to upper side, and as such, it
got very hot. Could I have blown this one by doing that?

Or could there by something else wrong which causes them to fail
immediately?

> Make sure the large electrolytic caps in the power section are
> not loose, and that none of the 6 rectifier type diodes in the drive
> have failed.

Without removing them, it's low resistance one way, and higher (and
slowly rising) the other - I assume this is okay?

Again, thanks for the advise.

The interface to the system was 16bit, internally they did some operations
32bit.

> P.S.: Were there ever any 1, 2 or 4-bit computers ??? And were they
> really called computers ???
There were 4bit ones - the computers that NASA used on the Apollo for
craft control were 4bit. Can't remember how much RAM though. Did the job
well enough!

> > bit-rate clock speed (MHz)
bit-rate isn't the right term and means something totally different. You
normally just say CPU X is an 8bit CPU not that it has a 8bit-rate.

The circuit makes a circle or diamond, but the four actual diodes on the board are laid out like two equal signs '= =' at the extreme left rear between the power jack and the large silo-like capacitors.

With the power disconnected, check the resistance in each direction across each individual diode (CR17, 18, 19, 20) for one that is shorted. I had one go out and a 276-1141 from the Shack fixed me up.

Guy from NASA/IBM actually came by my Jr. Highschool ~40 years ago to do a show and tell. Can't remember much, backend of your car sounds about right for the first iteration. I think he actually had prototypes or mockups that were breadbox size, which he said NASA said "Get it smaller" and finally down to about the size of a notebook which they accepted. He said even when they hit the size weight constraints they continued and eventually got it down to about the size of a transistor radio.

Also got to take tour of IBM. They were the neatest company in the world back then. For instance; rumor was someone figured out the cost of putting parts back in inventory was significantly higher then the cost of the parts so it was company policy to let researchers keep the parts.

NASA itself was a neat bunch, before they got old and lawyers took over the world. I remember a NASA representitive setting off a rocket in the HS gym. Try that now and 100 parents will file lawsuits for reckless endangerment.

One of my friends that used to work in aerospace before he moved into the pharmaceutical field used to laugh about some of the craziness that went on. He said someone had a demonstration mixed fuel rocket engine they would set off at conventions. All it was: A tank of liquid oxygen and a metal tube internally lined with a thick layer of plexiglass. They would set the thing off and supposedly everyone would be death for an hour.

One of the 'private enterprise' launch rockets<star'sumtin'> tried to use the same concept only scaled up. I think they changed a few things, maybe used polyisobutlyene. It has the inherent advantage of being able to be throtled.

Rockets were the orignal reason I got into science. Kind of funny, but I never ended up working in the field. One of the products my company made, Transderm anti motion sickness patch, is carried on all the space shuttle missions. Every once in a while you will see a shuttle astronaut with one stuck behind their ear. Life is strange.

The sixteen/thirty two refers to the CPU which was a Motorola
68000. It has a 32bit core but only a 16 bit memory bus.

The later TT (thirty two/thirty two) machines had 68030 CPUs which
had a full 32bit memory bus.

All,
YES! You can OCR the program files and save them as straight ASCII
text. Of course any Atari character graphic characters will NOT convert
properly on anything other than an Atari since ATASCII is a bit
different the ASCII. Anyway, once you get the major part of the file
OCR'd you can open any ATARI 8-bit text editor and add the NON-converted
characters back in resave as an ATASCII text file the ENTER it into
BASIC. It work's great! BTW, If you know the actual numeric ASCII value
of the characters, you can add them in on ANY text editor. They just
won't display properly on anything other than a Atari 8-bit system.

+10V is fine. The AC power supply grants 9V AC, which means approximately
10V DC if no load is put onto the lines.

Is the +12V ok? The +12V are generated by a voltage doubling circuit between
the three huge capacitors in the rear. Looks like this:

O
=O
O

O are the huge capacitors, the two diodes of the voltage doubling circuit
are in between. Check the board under the diodes - if it looks a bit brownish,
they're dead. This happened to one of my drives here. Problem is that the 1A
types Atari used here are a bit too weak. You might want to fit 3A or 5A
types here.

> Now, in the process of putting this new regulator in, I may have had to
> use the soldering iron a little more than I would have liked to get pin
> 2 to connect on the not so easy to get to upper side, and as such, it
> got very hot. Could I have blown this one by doing that?

Not very likely. These regulators can stand quite a lot. Might this is some
short cut at the +5V supply, i.e. try to un-solder the output line of the
7805, apply a resistor of 1K or lower to have a load on its output, and
measure the voltage again. With the output of the regulator unsoldered,
try to measure the resistance between the corresponding connection on the
board and ground - middle pin of the 7805.

> Without removing them, it's low resistance one way, and higher (and
> slowly rising) the other - I assume this is okay?

How low and how high? How does the board beneath the diodes look like?

So long,
Thomas

Hi All,

does anyone have any feedback on the various Atari8 emulations
available that will run under Windows2k? I'm looking primarily for
compatibility but additional features (like Rambo emulation) would be
nice.

Also, what is the status of the various old Atari 'bibles'? For
examples I have copies of 'De Re: Atari' and 'Mapping the Atari' in
my parents attic and I'm wondering if I should dig them out next time
I'm visiting, or if someone has scanned/OCRed them and put it on the
web.

In reference to this message, and this is going to show my stupidity
in reference to how ST Xformer works..

Am I correct in assuming that you have to convert a program to a
particular format to make it work with Xformer? What are the
limitations on what you can convert (for instance, could I make a BBS
program work on the ST in basic, or possibly terminal program?).. And
what operating system do you do this conversion under?

Thanks!

Hi!

I am a new user of (old (;-)) ATARI Portfolio.
I've received it with a Parallel interface too, and also the cable.

But on one side of the cable, there is written PF (like Portfolio), on the
other side ST (like ATARI ST).
Is it the same for PF2PC as for PF2ST???
If not, could you please tell me, which pins should be connected in the
cable? (I heard that not all of those 25 must be...)
And some hint how to transfer files?

Thanx alot.

Bye Petr

5915. Help with DLIs

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-27 23:14:16 UTC
From: Mopar Man <nospam@nowhere.com>
Message-ID: <9v87rtkocqfian4300pehdtajf167br9kl@4ax.com>
Source record: 33938

I'm having some trouble getting multiple DLIs to work correctly. What I have done, is set up a custom Graphics 9 (BASIC) display list. It has sixteen evenly spaced DLI's, so that I can have sixteen colors going down the screen. By drawing bars of 16 shades across the screen, I get all 256 colors on the screen with minimal effort.

I am using a table driven DLI routine, where the offset into a small table pulls the color for the next DLI. Problem is, the first color in the table doesn't always end up at the top of the screen (where the first DIL bit is set in my display list). I hope I am describing this clearly. Basically, the first color on the screen is random, and the following colors appear in order, as they do in the list. The main program is done in Atari BASIC, with the DLI code read in from DATA statements.

Does anybody have an idea as to why this is happening? I am hoping to build an SIO2PC cable very soon, so I can develop on my PC. I'll include my little assembly code for the DLI's below. Oh - I did try using zero page addressing to speed things up, but it made no difference.

```
PHA ;Push A
TXA
PHA ;Push X
LDX OFFSET
LDA COLORS,X
STA WSYNC
STA COLBAK
INC OFFSET
LDA OFFSET
CMP #16 ;Done with 16th DLI?
BNE SKIP
LDA #0 ;Reset offset for next time through table
STA OFFSET
SKIP PLA
TAX ;Restore X
PLA ;Restore A
RTI ;Return from DLI
```

Are you sure you have the table indexed and pointed to right?

Only other thing that comes to mind is making sure you have the first DLI
set high enough in the display list. I think you actually want your first
DLI to be on the last blank line, 112+128 for its value.

A quick and dirty way of testing is just debug it with a graphics zero
screen. Just add another bit of code like.

```
TYA
PHA
at the start
LDY OFFSET
STA SCRMEM,Y
somewhere in the middle
PLA
TAY
```

You should get a blank followed by a heart etc going across the top line of
the display.

Most monitors remember the size after you adjust it for different resolutions/
frequencies. I remember having to do this after having my display set for
1152X864 but playing games at 800X600.

Rather than reply to each message about Apollo computers, see:
http://www.hq.nasa.gov/office/pao/History/computers/Compspace.html

As for size, from:
http://www.hq.nasa.gov/office/pao/History/computers/Ch2-5.html

"[34] The Apollo Guidance Computer was fairly compact for a computer
of its time. The CM housed the computer in a lower equipment bay, near
the navigator's station. Block II measured 24 by 12.5 by 6 inches,
weighed 70.1 pounds, and required 70 watts at 28 volts DC. The machine
in the lunar module was identical. "

And it used a 16 bit word. No drum memory.

Dave

I was wondering at the feasibility of upgrading an atari 800 to be almost, if not totally, 100% compatible with the 130XE. How difficult would that be to do?
I have an XE game system - would it be possible to rip the freddy chip out of there and use it in an 800? (probably a lot more difficult then that)

As well, does anyone have any detailed plans on how to upgrade the memory on the 800? I can find a little bit of info, but nothing detailed enough to do it myself.

How do you make sure that OFFSET is zero when you enter the first DLI,
i.e. how do you synchronize with the screen? I'd rather suggest to either
check the vertical counter of ANTIC to reset the counter, or to install
a VBI to reset it.

The second problem with your approach is that the topmost color will always
be the one in COLBK, the shadow register of the Os for the GTIA background
color register. You might want to load the first color into the shadow
register, install only 15 DLIs and poke colors 1..15 into the background
register within the DLIs.

So long,
Thomas

Gee - so simple I'm almost embarassed to post the bug. I wasn't
correctly setting my offset pointer in BASIC. I found that setting it
directly before enabling the DLI code did the trick. I also made a
few changes to the assembly code, shortening it another few lines.
Now I can move on to other things. Thanks for the tip.

5923. Sector editor

Newsgroup: comp.sys.atari.8bit

I'm looking for a sector editor for my 800 something like the early versions norton editors.

Also is Bravo Siarra(sp) a reputable retailer for Atari. I'm looking for an 850 or equivalent.

Thanks

5924. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2001-09-29 03:55:17 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <trahfadvupsc8f@corp.supernews.com>
Source record: 33797

How to tell which Atari Basic Revision that you have:

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

Thanks for the advise - Much appreciated.

It's all gone a bit weird now. As I said before, there was nothing on
the output pin with either of the regulators. So I put a variable
resister between the output and earth. Initially I set it to 1K, and to
my surprise, I got 5v. Turned the resister down to nothing, and I still
get 5v. There was nothing there before, so I can only assume something
wasn't connecting right.

However, even though the 5v is there now, it's still not working.

Incidentally, having removed and replaced the drive mechanism so many
times now, I'm hoping I haven't put the plugs back in the wrong order.
I've got it like this on the multiple plug connector at the rear left:

```
o o o o o o o o o o o o o o o o o
|_____| |_| |_____| |_____| |___|
J11 J12 YGBR J10 13
```

Can you confirm this is correct please?

> > Without removing them, it's low resistance one way, and higher (and
> > slowly rising) the other - I assume this is okay?
>
> How low and how high?

Just over 1 ohm one way, and rises from 3 and ever upwards the other
way. The same for the 12v diodes.

> How does the board beneath the diodes look like?

No brown-ness apparent.

> Can you confirm this is correct please?

YGBR is called J1 here, oriented such that Y is towards the front of the
drive. 13 is called J14 here. The connectors are numbered, their number
fits the label on the board. If the front of the drive points towards
you, the numbers point towards the right, and the YGBR connector,
running to the step motor, shows a slight offset to the right from
the remaining connectors.

So long,
Thomas

I wrote a program taht did that myself, you can find it together with my
TV calibration program (in fact, it's part of it) at:

http://www.geocities.com/Hollywood/2645/A8/

Just grab the file "Tv_calib.arc.zip" and save it without the .zip extension
(because it's really only an .arc file), run the program and choose the
"Atari 256 colors" menu option.

>I am using a table driven DLI routine, where the offset into a small

IIRC, you have to disable the screen first... then reenable it after
setting all the DLIs. Check my code, I wrote it long ago...

>on ATR - the manuals there too.

I'll second that recommendation, I used "Diskey" for years back in the early
80s and never found anything better for general use.

Though I'm probably biased as I got it free in amongst a ton of other stuff
I was given when a computer shop was shutting down. :-)

TTFN - Pete.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Having a quick clearout!

Atari 800XL with 256K RAM, 800XL with stereo upgrade (not sure that it's working, but the 800XL works as it should), 65XE with XEP-80 interface, 1050 disk drive, good selection of software, plus Atari 2600 and 2600jr with 8 or so games.
ï¿½100 including shipping for the lot.

Alternatively:

256K 800XL with 1010 and 1050 - ï¿½40
Stereo 800XL - ï¿½20
Atari 65XE with XEP-80 - ï¿½20
2600jr - ï¿½5
2600VCS with Crystal Castles, Dark Chambers, Centipede, Dig Dug, Combat, Pele's Soccer, Adventure and Pac-Man - ï¿½20

NeoGeo Pocket with Ms. PacMan, ï¿½40

Atari Lynx II, boxed as new, with 5 games (Ms. PacMan, Ishido, Bill & Ted, Klax, Chips Challenge), ï¿½60

Compaq 386 luggable, good condition, with 3Com NIC and Roland SCC-1A plus MIDI leads, ï¿½60 (don't laugh, the card is worth more than the machine ;))

Roland MPU-401 with leads and software, ï¿½15

Roland D110 sound module, has a fault on the output stage that makes it distort, ï¿½30

Wanted: YK-20 controller for Yamaha MSX (CX5MII/128), swap Casio CZ-1000 or 101. Also disk drives and other accessories for the CX5MII, and possibly a CX7M? (The MSX2 variant).

Richard

Source record: 33813

I put one of my old disks in a perfectly working 1050 and tried to boot with it. It started to boot but then I got boot errors. Now, the drive will not boot any other disk (even ones I know are good) nor will it read disks when I set it up as D2. Turning it off and letting it cool down did not fix it. I put the same disk in another 1050 and tried to boot. Now the other 1050 will not read disks. When I examined the disk, I saw what looked like a couple of ridges or bands in the surface of the disk itself. Somehow, this disk ruined two drives. Does anyone have a suggestion? I looked for a head cleaning disk but cannot find one for 5 1/4" disks. Should I open it up and clean the head with alcohol or is the problem much worse than that? Please help!

5941. FA: Atari 2600 Taiwan Pirate boxed!

It sounds like the disk had a build up of dirt (magnetic media?) and
basically the grime got dumped onto the heads of your drives when they spun
up.

You should be able to use Q-Tips dipped with rubbing alcohol to clean
the heads.

Please note the the head is on the bottom, facing upwards. It's about
the size of a dime, black, with a white rectangle in the middle. Do not
attempt to clean the pressure pad on the top.

The disk should never be used again.

Well, it's not been very active lately (sadly, as I could use some
help with a few little programming projects). However, #Atari is up
on a dal.net server.

I downloaded Atari800WinPlus from http://www.atarihomesoft.f2s.com
It seems pretty good. On the left pick Emulatoren/Tools and download
the emulator(s) and the ROMs.

You can also use xlsearch at http://www.newbreedsoftware.com to
download those old programs you want to play! :v)

Specifically, it's hiding under:

http://www.newbreedsoftware.com/xlsearch/

An easy-to-remember URL for it is:

http://xlsearch.atari.org/

XL Search isn't an archive, it's a searchable index of what's available AT
archives, BTW.

5949. Packer/unpacker

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-01 09:58:49 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <3BB83E59.E5EF10D@asw.cz>
Source record: 33824

Hi,

I'm looking for executable packer/unpacker for 8bit Atari.

Conditions:
1) It must have high compression level
2) Unpacker code must be short, fast and run on any 64kb Atari.
3) Source code is welcome
4) Speed and memory requirements for packer are uninteresting, I'll
rewrite it for PC.

Anyone?

Jindroush (kubecj@asw.cz)

Sorry for the repost, corrected a couple of errors ;)

Atari 800XL with 256K RAM, 800XL with stereo and PIA upgrade (not sure
that stereo is working, but the 800XL works as it should), 65XE with as-
new XEP-80 interface, 1050 disk drive, good selection of software, plus
Atari 2600 and 2600jr with 8 or so games.
ï¿½100 including shipping for the lot.

Alternatively:

256K 800XL with 1010 and 1050 - ï¿½40
Stereo+PIA 800XL - ï¿½20
Atari 65XE with XEP-80 - ï¿½20
2600jr - ï¿½5
2600VCS with Crystal Castles, Dark Chambers, Centipede, Dig Dug, Combat,
Pele's Soccer, Adventure and Pac-Man - ï¿½20

NeoGeo Pocket with Ms. PacMan, ï¿½40

Atari Lynx II, boxed as new, with 5 games (Ms. PacMan, Ishido, Bill &
Ted, Klax, Chips Challenge), ï¿½50

Compaq 386 luggable, good condition, with 3Com NIC and Roland SCC-1A
plus MIDI leads, ï¿½60 (don't laugh, the card is worth more than the
machine ;))

Roland MPU-401 with leads and software, ï¿½15

Roland D110 sound module, has a fault on the output stage that makes it
distort, ï¿½20

Richard

Source record: 33825

Hello,

ABBUC is still the biggest atari club in the world. The have 445 members and
the send the members a nice printed magazine with a diskette. A member ship
costs about 60 DM. The JHV is a meeting that will take place every year this
year the 16 meeting will take place. I think they have done a great job
until now to support the 8-bit atari and they still do.....
You can look at www.abbuc.de when you're interested in it.

Abbuc rulez. Join the club, you get a nice magazine and diskette with lot's
of programs.

-= Atari 8-bit is still alive =-

Gtx,

TXG/MNX

I don't think option 1) and 2) can be combined into one Atari 8-bit util...

: 3) Source code is welcome
: 4) Speed and memory requirements for packer are uninteresting, I'll
: rewrite it for PC.

Tom Hunt wrote UNZIP for Atari 8-bit (supports only shrink compression), but I don't think this is what you are looking for.

I'm sure you know about Jiri's "SuperPacker". Depacking speed and depacker-size are o.k. LZW-packer cruches better, but depacking is slow and requires more code to depack...

That's okay then, thanks.

Progress update:

Took this new regulator out, cleaned it and the connectors up, and it looks like the circuit board contact on the middle pin had broken - I assume that's why this new regulator wasn't working.

So, I've put it back in, connected the middle pin to other places on the circuit by some wire, and it now switches on, I have power, and the LED now lights up again. However...

It is now not recognizing when a disk is inserted. IIRC, when a disk goes in, it will spin up or something - It doesn't do that - It does nothing.

The computer recognizes that it's connected as it displays "BOOT ERROR", but the disk won't spin. All the connectors appear to be okay, but

continuity would be rather difficult to check as the wires go right into the motors etc without any bare contacts to put a multimeter onto.

Well I'm out of ideas. If no-one here has any more suggestions, it looks like it's trash-bound. :-(

It doesn't matter as I don't want to compress the program on Atari. I'll
do it on PeeCee.

> I'm sure you know about Jiri's "SuperPacker". Depacking speed and

I don't know any packers. In the times I used real Atari, there were
none available (AFAIK).

Message-ID: <DBIu7.1935$no1.20891@typhoon.sonic.net>
Source record: 33833

I'm (finally) updated my old "Atari 8-bit New User, Emulator Help FAQ"
and I wonder if people can give me an update on what kind of emulators
are out these days.

The old list I had included:

PC Xformer
ST Xformer
XL-It!
Rainbow
Rainbow95
Atari800
ACE

There's Atari800Win and a Win version of PC Xformer now. What else
have I missed?

Thx!

-bill!

5960. The Atari 8-bit New User, Emulator Help FAQ - 2.3

Welcome to:

The Atari 8-bit New User, Emulator Help FAQ

Revision 2.3, October 3, 2001
By Bill Kendrick

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:

* Atari 8-bit FAQ (http://www.faqs.org/faqs/atari-8-bit/faq/)
* You can also ask the FAQ keeper, Michael Current, for a copy at:
mcurrent@carleton.edu
* The two parts of the FAQ are also posted on the 1st and 15th of
each month to the comp.sys.atari.8bit Usenet newsgroup.

If you want the latest copy of this FAQ:

* Atari 8-bit New User and Emulator Help FAQ
(http://www.sonic.net/~nbs/new_and_emu.html)
* Ver. 1.5 En Espanol
(http://www.sonic.net/~nbs/new_and_emu.espanol.txt)
* You can also instantly receive a text copy of this file by sending
e-mail to the author at: bill@newbreedsoftware.com and placing the
sentence "send emulator faq" in the "subject" of the message.
* This file is also occassionally posted in text format on the
comp.sys.atari.8bit and comp.emulators.misc newsgroups.

Table Of Contents:

* Recent Changes
* Objectives of this FAQ:
* Summary of Atari 8-bit Models and Emulators

+ Real Ataris
+ Atari Emulators
o For DOS-based PCs
o For Windows-based PCs
o For MacOS
o For Unix/Linux
o For Atari ST/TTs
* Capabilities of an Atari 8-bit
+ Graphics
+ Sound
* Questions and Answers
1. What does "READY" mean?
2. Why doesn't this program load?
3. How do I disable BASIC?
4. Why doesn't this game/program run correctly?
5. How do I exit the emulator?
6. How do I get to Atari DOS?
7. How do I use files which are not in disk images with an
emulator?
8. How can I manipulate disk images?
9. Just what ARE .ATR, .PRO and .XFD files?
10. What are SIO2PC and APE?
11. What is XFSIO?
* Getting around on the Atari: DOS and OS
+ AtariDOS and MyDOS QuickReference
+ General DOS and OS questions
1. How do I access the disk drives?
2. How do I copy things from one place to another?
3. What are subdirectories?
4. What does "P:", "E:", "K:", etc. mean?
5. How do I print something from DOS?
* Getting around on the Atari: BASIC
1. What does "READY" mean?
2. Where can I learn Atari BASIC?
3. How do I quit BASIC?
4. Why don't strings work?
5. How do I make graphics?
o Atari OS Graphics Modes
o Atari BASIC Graphics Commands
o SETCOLOR Hue Values
o Colors
6. How do I make sound on the Atari?
7. How do I move the cursor and edit?
8. How do I make the editor characters appear?
9. What's with the colors changing?
10. How do I access 'devices' in Atari BASIC?
* Getting Atari files to a PC
1. How can I read Atari disks on my IBM?
2. Ok, I can't do any of that, now what?
3. How can I convert DiskCommunicator (DCM) files to and from

other disk image formats?
* Where to get or FTP files mentioned in this FAQ
* The End

Recent Changes:

* Since v.2.2 (April 27, 1999): Verified and updated URLs and e-mail addresses. Added Table of Contents. Slight edits.

Objective of this FAQ:

At the time of its release (mid 1994), much discussion went on in the comp.sys.atari.8bit Usenet newsgroup about the Atari 8bit emulator for IBM / MSDOS based computers, PC Xformer 2.0 (XF2 for short). Many people in the 8-bit community had gotten fed up with the XF2-based questions which did not pertain to them, or to the very simple questions which came up time and again which bothered regular readers / digest subscribers.

This file was created to reduce the number of 'newbie' and XF2 questions. Now it's becoming a fairly good reference, and of course includes information on all of the other emulators that have come since then.

This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, Read The Fine Manual) and "how do I get a disk directory?"

It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a supplement to the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

Summary of Atari 8-bit Models and Emulators

* Real Ataris: Atari 8-bit computers were produced between 1979 and 1987. The major models released (there were, at the least, prototype versions of a few other models) were the:
+ 400 - 8K-16K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 800 - 8K-16K-48K, 400/800 OS, CTIA or GTIA graphics (depends when made)
+ 1200XL - 64K, 1200XL OS, GTIA graphics
+ 600XL - 16K, XL OS, GTIA graphics
+ 800XL - 64K, XL OS, GTIA graphics
+ 800XE - 64K, XL OS, GTIA graphics (European release)
+ 65XE - 64K, XL OS, GTIA graphics
+ 130XE - 128K, XL OS, GTIA graphics
+ XEGS (Game System) - 64K, XEGS OS ("Missile Command" game

built-in), GTIA graphics
The XE's and all of the XL's except the 1200XL had BASIC installed
on ROM. BASIC can be purchased on cartridge for the 400, 800 and
1200XL.
* Emulated Ataris:
+ For DOS-based PCs:
o PC Xformer 2.x. Limited Freeware demo (no source code).
o PC Xformer 3.0x. Powerful Commercial version (no source
code).
o XL-It! Powerful Public Domain version (no source code
yet).
o ACE Unfinished, Public Domain "vace" for SVGA (including
source code).
+ For Windows-based PCs:
o Rainbow 95. Limited Freeware demo (no source code).
o Rainbow 95. Powerful Registered Shareware version (no
source code).
o Atari800Win Powerful Open Source version.
+ For MacOS:
o Rainbow. Limited Public Domain demo (no source code).
o Rainbow. Powerful Registered Shareware version (no
source code).
+ For Unix/Linux:
o Atari800 Powerful Open Source version.
o XL-It! Powerful Public Domain version.
o ACE Unfinished, Public Domain "xace" for X-Window
(including source code).
+ For Atari ST/TTs:
o ST Xformer 2.x. Limited Public Domain (previously
commercial) (including source code (I think)).

Capabilities of an Atari 8-bit:

Graphics:

* Playfield Graphics (Bitmaps):
The Atari has maximum resolution of 320 x 192 x 2 colors.
(standard, non-overscanned screen).
160 x 192 x 4, 160 x 192 x 2, 160 x 96 x 4, 160 x 96 x 2,
80 x 48 x 4, 80 x 48 x 2, and 40 x 24 x 4 graphics are also
supported.
GTIA (newer 800's and all XLs/XEs) graphics support 80 x 192 x 16
shade-only, 80 x 192 x 16 hue-only, and 80 x 192 x 9 color screen
modes.
Special software-based modes (using page-flipping and interlacing)
can achieve 80 x96 x256 colors, 80 x192 x256 colors, 80 x192 x4096
colors, and 160 x192 x30 greys.
* Text:
In all text modes, character set indirection (fonts) is available.
The XL/XE's also come with a second ROM-based font which contains

"international characters" in place of the graphical shapes.
40 x 24 x 256-character (128 normal, 128 inverse) text mode is standard (2 colors).
20 x 24 x 64-character and 20 x 12 x 64-character modes are built-in. (The remaining 192 characters are identical to the first 64, but in 3 different colors)
40 x 24 x 128-multi-colored-character (4 colors per character allowed, the other 128 characters have pixels of the 4th color changed into a color #5) and 40 x 12 x 128-multi-colored-character screen modes are available, and in the XL/XE's are available through the OS (on the 400/800, you must create them yourself).
* Underscan/Overscan:
Normal (bordered), narrow (underscanned), and wide (overscanned) screen widths are available. In modes which typically have 40 bytes per line, narrow mode presents 32 and overscanned mode presents 64 bytes per line.
* Display Lists:
Screen modes can be mixed (by lines) down the screen using the Display List (similar to "Copper Lists" on the Commodore Amiga; a "program" which is executed by the ANTIC graphics chip every screen refresh (60 times per second on real NTSC Ataris, 50 times per second on real PAL Ataris).
All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via a "Display List Interrupt," where the CPU is interrupted to execute special code when a line containing an "interrupt" is processed by ANTIC.
* Scrolling:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.
* Player/Missile Graphics (Sprites):
Four 8-bit wide and 128 or 256 byte high single-color "players," and four 2-bit wide, 128 or 256 byte high single-color "missiles" are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority (you can specify which players and missiles appear "on top of" or "below" other players, missiles or playfield graphics) and collision detection (where, instead of creating your own complicated code, the ANTIC chip can tell you when players and/or missiles touch each other or the playfield).

Sound:

* Four voices of 8-bit pitch-resolution (3.5 octaves), 4-bit volume-resolution, and one of 8 "distortions" can be produced. 2 voices (voices 1 and 2, and/or voices 3 and 4) can be combined to make 16-bit pitch-resolution. Also, 4-bit volume-only modes can be enabled for digitally sampled soundreplay.
* A fifth "voice" is produced by the internal speaker on Atari

400/800's (for keyclick and buzzer) and in the XL's and XE's this
was rerouted through the normal audio output. (The OS's keyclick
can be disabled, and you can of course create your own sound.)
* Some hardware stereo upgrades (like "Gumby") exist which double
the number of voices and add a right-channel to provide true
stereo. (Not much software supports this.)
* Some hardware upgrades (like "Covox") exist which double the
resolution of the "volume-only" audio capabilities of the Atari to
8-bits. (Not much software supports this, either.)

-- Questions and Answers: --

This section contains some typical new-user and emulator-user
questions. The answers are directed to both regular Atari users and
emulator users.

1. What does "READY" mean?
This is the Atari BASIC prompt. See the BASIC section, below.
2. Why doesn't this program load?
The program may not work under the Atari 800 Operating System, it
may require the XL/XE Operating System. Be sure you're in 800XL or
130XE mode. (Note: Not all (versions) of emulators support XL/XE
modes!)
It may not work under the XL/XE Operating System (rare cases),
switch to 800 mode.
Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
It might be a BASIC program! Be sure you're in BASIC and use the
BASIC "RUN" or "LOAD" (and then "RUN") command. Also, be sure it
works with the BASIC you have. Some programs only run in BASIC XL
or XE (which are both cartridge-based BASIC's not easily available
to an emulator), and some run with TurboBASIC XL (disk-based).
(Note: BASIC files usually end in the extension ".BAS," ".BXL," or
".TBS," for Atari BASIC, BASIC XL, and TurboBASIC XL,
respectively.)
It may just refuse to run on the emulator.
3. How do I disable BASIC?
+ Real Atari XL/XE: Hold the [OPTION] key while turning the
power on or rebooting
+ PC Xformer: Press [SHIFT]-[F10] to reboot with BASIC disabled
+ Rainbow: ???
+ Atari800: Run with the "-nobasic" command-line switch
+ Atari800Win: ???
+ XL-It!: ???
+ ST Xformer: ???
+ ACE: ???
4. Why doesn't this game/program run correctly?
It may use player/missle collision detection which is not
supported on some versions of emulators.
See "Why doesn't this program load?", above.

5. How do I exit the emulator?
+ PC Xformer: Press [F5]
+ Rainbow: Press [Apple]-[Q] or select "Exit" from the "Apple" menu.
+ Atari800: Press [F9] or close the window
+ XL-It!: ???
+ ST Xformer: ???
+ ACE: ???
6. How do I get to Atari DOS?
In BASIC, type "DOS" at the "READY" prompt.
Reboot without BASIC on.
Be sure you have a DOS-bootable disk image loaded / floppy disk inserted into drive 1 ("D1:").
7. How do I use files which are not in disk images with an emulator?
To "install" files as though there were plain disks with PC Xformer, simply add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XFORMER MYDOS45.ATR filename.ext To use a file from your Mac in Rainbow, make sure the disk image in drive 1 has enough space for the file, and select ???. The file will be added to that disk image.
In Atari800, use the "H:" drive from within the Atari to access files on your filesystem. If the program is executable, you can boot Atari800 and load and run the single file by using the "-run" command-line option. To use Unix files in XL-It!, ???.
To use MSDOS or Unix files in ACE, ???.
8. How can I manipulate disk images?
Use the MSDOS program S2PC which allows you to access files within a MyDOS/compatible .ATR disk image. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.
Use the MSDOS program ATARIMG, which is much like S2PC but has a nicer, more graphical (less-menu driven) interface.
(Unfortunately, this doesn't run on all IBM's!)
Use the Mac program Virtual Disk Editor ???.
9. Just what ARE .ATR, .PRO and .XFD files?
Refer to the XFormer, SIO2PC and APE manuals for details on these files.
Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will be approximately 88k.) .ATR files are used by SIO2PC and APE (see below) as well as most Atari emulators. .XFD files are used by ST Xformer and PC Xformer. .PRO files are like .ATR files, but they include some copy-protection scheme information; these files are used by APE.
10. What are SIO2PC and APE?
Refer to the SIO2PC manuals for details on this program.
Refer to the APE manual and SIO2PC hardware manual for details on

this program.
These are a programs which run on IBM/compatibles under MSDOS. (APE can also run under "dosemu" for IBM/compatibles running Linux). With the use of of a simple (and relatively inexpensive) cable, the software makes the IBM act as though it were a number of Atari peripherals. SIO2PC emulates up to four disk drives (any drive ID numbers from 1 to 8 are allowed) and a printer. APE emulators up to eight disk drives, a printer, and a modem (RS232). They use disk image files (.ATR's) and can also let the Atari access plain IBM files. SIO2PC does this much like PC XFormer does, making the single file its own disk. APE allows you to navigate your PC's drives through an Atari drive. The printer emulation of these programs redirect Atari "P:" writes to the PC's printer. SIO2PC can also direct the output to the screen or to a plain IBM file. Different text translations/conversions are available. (APE also allows keyboard macros, command key redefinition, the ability to save the current drive/etc. configuration and load it later as a "block", and the ability to both emulate copy protected disks (with it's own extension of the ".ATR" format, the ".PRO" format (which will hopefully be used in future versions of Atari emulators)) and create disk images from copy protected disks (with a special cable). SIO2PC may soon have this ability as well, since the documentations say it has been planned for a while.)
11. What is XFSIO?
Refer to the XFSIO manual for details on how to use this program. XFSIO is a shell for PC XFormer, XLiT!, APE and SIO2PC which allows you to set the command switches for the previously mentioned programs. It also allows you to comment each 'virtual disk' with up to 132 characters, and can search the database to find which disk a particular title is on.

-- Getting around on the Atari: DOS and OS --

Note: This section will simply discuss Atari BASIC, the Atari OS, and Atari DOS 2.5 and MyDOS 4.5x (because these topics seem the most relevant to the less-knowledged/experienced Atari 8-bit users). No emulator-specific information will be presented.

* AtariDOS and MyDOS QuickReference:
MyDOS (4.50 and 4.53) presents the user with the following commands:
+ [*] Disk directory of current directory (like "dir *.*" in MSDOS and "ls *" in Unix)
+ [1]-[9] Disk directory of a disk drive (like "dir a:*.*" to "dir i:*.*" in MSDOS)
+ [A] Disk directory (like "dir <mask>" and optional output destination in MSDOS) You'll be prompted for a directory listing mask (like "D1:*.*" or "D3:GAMES:*.EXE")
+ [B] Quit to cartridge

+ [C] Copy file(s) ("[source],[destination]" copies from one
place or disk to another, just "[source]" copies from one
place on one disk in a drive to the same place on another
disk in the same drive (asks for swapping))
+ [D] Delete file(s) (add "/N" to delete without being prompted
first) (add ">*.*" or ":*.*" after a subdirectory name to
delete the files within it. A subdirectory name alone will
delete the subdirectory (if it is empty and unlocked)). (Acts
like both "del" and "rd" in MSDOS and "rm" and "rmdir" in
Unix.)
+ [E] Rename file(s) (renaming multiple files is allowed, but
be careful) (Like "ren [old] [new]" in MSDOS and
"mv [old] [new]" in Unix. With MyDOS and AtariDOS use ","
between old and new masks.)
+ [F] Locks file(s) from overwrite, deletion and appending
(like "attrib +r [mask]" in MSDOS and "chmod 555 [mask]" in
Unix.) (It makes them "read-only.")
+ [G] Unlocks file(s) (returns them to their default state).
+ [H] Writes DOS files to a disk (this creates a disk which
boots with the current version of MyDOS you are using and
also has the menu file "DUP.SYS" on it as well).
+ [I] Formats a disk (add "/N" after the drive number to do a
quick-format of an already-formatted disk (ie, just a very
fast way to delete all the files on the disk.))
+ [J] Duplicate disk (copies an entire disk, including boot
sector, and every other sector!!! When using disk images, as
with emulators, SIO2PC or APE, it's much quicker to just copy
one .XFD or .ATR to another).
+ [K] Make binary file: saves memory and makes it
binary-loadable. See [L].
+ [L] Load binary file: loads a compiled program. (like
"[filename]" in MSDOS, except any ".EXE", ".COM", ".OBJ",
etc. is still required.)
+ [M] Run at address. Mainly for advanced users. Reboot is
"E477", reset is "E474" (these are the hex values of the
addresses where the routines to reboot and reset are.)
+ [N] MEM.SAV: when this is on, whenever you go to DOS (from
BASIC, for example) it will write what is in memory to a file
"MEM.SAV" so that when DUP.SYS (the menu) loads it isn't lost
forever. When you exit DUP.SYS with the "B: Run Cartridge"
command, MEM.SAV is reloaded and the environment should be as
it was when you left. It's probably quicker to simply "SAVE"
your programs (if in a language) which aren't nearly as big
as all of the memory that MEM.SAV saves.
+ [O] Options: this presents the user with some options. Mainly
for advanced users or special setups. See the MyDOS docs for
details.
+ [P] Set density. Forces a drive to be recognized at a certain
density if MyDOS can't figure it out. (???)
+ [Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).

+ [R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS) This makes "D:" now the same as a subdirectory or other drive. ie, "D2:" will make all calls to "D:" act as though they are to "D2:" instead. Some programs when prompting for filenames do not add "D:" to the beginning if one is not present, they add "D1:". If you don't trust a program to look to "D:" instead of "D1:" and you want it to look to some place OTHER than "D1:" (ie, where "D:" is pointing which could be a VERY long path list), just add "D:" to the beginning. ALSO, some programs don't even ADD "D:"'s if they aren't in the filenames you give and may give errors (138, for example: device not present, ie, if you said "TESTFILE.DAT" it may think you want "T:" instead of "D:TESTFILE.DAT").
+ [S] Set ramdisk number. This is also under [O]ptions.
+ [V] Verify writes. This is also under [O]ptions. When Verify is on, writes will be slower but 100% reliable. With it off, writes will be much faster but possibly not as reliable (on bad disks, for example). Default is off.

AtariDOS presents the user with the following commands which are identical to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H, I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or not the same as MyDOS's commands:

+ [O] Duplicate file. This is used to copy a file from one disk to another using only one drive. (In MyDOS, giving just a source will make [C]opy act like DOS 2's Duplicate.)
+ [P] Format Single. In DOS 2.5, this is used to format 88k (Single Density) disks. To format an Enhanced Density (127k) disk, just use [I]. In DOS 2.0, [I] is the only format option and only handles 88k. (I may be wrong, but I have never had a Double Density drive under Atari DOS 2.0 or 2.5!)

* General DOS and OS questions:

1. How do I access the disk drives?

First, you need to have booted with a DOS. All but one DOS is on disk (SpartaDOS X is on cartridge). When the Atari boots up, it does some of its 'boot-up stuff' which includes looking for a disk drive connected and turned on which is set up as drive #1. It then begins to load from the disk's "boot sector". If none exists or there's a nasty error on the disk, you get the "BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks, even non-bootable disks have a boot sector, but all the boot sector is is a small program which displays a 'not a boot disk' error).

To end the digression, the answer to 'how do I access the disk drives' starts with 'you must boot the Atari with a DOS'. Check the 8-bit FAQ and the UMICH and other FTP archives for lists of DOSes available for Ataris, but the most used are Atari DOS (for compatibility with almost ALL older software), MyDOS (for an Atari DOS compatible high-end

DOS), and SpartaDOS (for a very high-end DOS which looks much like MS-DOS but unfortunately cannont run all software which runs fine with Atari DOS and MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's (except the cartridge versions and I believe disk version 1.1). Now that you have a DOS loaded, the Atari understands the "D:" device (see below for Atari devices). Since there is more than one disk drive, you have to be able to tell them apart. The Atari uses numbers when it has more than one of the same device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3, etc.!
After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.
2. How do I copy things from one place to another?
Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.
3. What are subdirectories?
Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes for the Atari and with MSDOS and Unix
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
UNIX / /games/ /games/space/
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.

In MyDOS and SpartaDOS (and MSDOS), you can change the
'current' or 'default' directory to a different place (a
different drive or a subdirectory). "D:" can stand for "D1:"
(like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ
THE MYDOS OR SPARTADOS DOCUMENTS FOR DETAILS ON THIS!
4. What does "P:", "E:", "K:", etc. mean?
As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
o C: Cassette
Readable and writeable, no filenames. Builtin to OS
o D: Disk Drive
Readable, writeable, random access, directory, files,
multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS). Requires an Atari DOS
o E: Editor
Readable, writeable. This is how input from the keyboard
and output to the screen is normally handled. If you
wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source. Builtin
to OS
o G: Graphics Printer
Writeable. This is not built into the Operating System
but must be loaded. This is an Epson-compatible printer
driver which can easily dump graphics.
o K: Keyboard
Readable. This is just the keyboard. Input from it is
not `echoed' back like with the "E:ditor". Builtin to OS
o M: "Multi-Mouse"
Readable, writeable? This is not built into the
Operating System but must be loaded. This is a handler
which runs in the background and accepts input from
either a mouse, a joystick or a touch-tablet and
displays a mouse pointer on the screen.
o M: "Multiplexer"
Readable, writeable. For Atari's connected to each other
via a "Multiplexer" local area network, the "MUX"
Operating System replacement provides an "M:" device for
computer-to-computer communication.
o P: Printer
Writeable. Send data to this and it will appear on the
printer. You can print files (documents, etc.) by using
"P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
Builtin to OS
o R: RS232 (COM port)
Readable, writeable, concurrent mode. This is not built
in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850
(or other compatible interface) and receives the "R:

handler" code from it. Other interfaces and the Atari
'direct-connect' modems require a file to be loaded
which contains the "R:" code. "R1:" and "R2:" is also
supported, but also its usage seems rare.
o W: Windowing (screens)
Readable, writeable. This is a graphics 8 graphical
windowing driver (rarely used, unfortunately!). It must
of course be loaded as well.
o Z: RTime8 Real-time Clock
Readable, writeable. This is also not built in to the
OS, but loaded. This is loaded from disk and lets the
user access the "RTime8" real time, battery-backed up
clock for the Atari 8-bit. (This is a cartridge-based
device). I am unaware of any "Z:" clone which let's you
set the Atari internal (non-real time,
non-battery-backed-up) clock if you do not have an
RTime8, although I'd love to see one! [hint!!]
5. How do I print something from DOS?
As stated above, just use the "C"opy command, then use the
file you wish to print as the 'source', and "P:" as the
'destination'. Example: "D1:DOCUMENT.TXT,P:" Except for ASCII
text files, you'll usually want to print from within a
program capable of opening the file, otherwise you'll print
garbage. A good rule of thumb is if you can see it when you
do a "C"opy to the "E:"ditor, then you can print it by
"C"opying it to the "P:"rinter.

-- Getting around on the Atari: BASIC --

1. What does "READY" mean?
Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
+ Entering a command will cause it to act immediately.
+ Entering a line number and then a command will place that
line into the current program (adding the line if that line
number didn't exist before, or overwriting it if it did).
+ Entering a line number alone will remove that line from the
current program.
+ To start a program, use the "RUN" command.
+ To erase a program, use the "NEW" command.
+ To clear variable values to 0 and kill string and array
declarations (thus freeing the memory they take up), use the
"CLR" command.
+ To load a program, use the "LOAD" command followed by a
filename (see below). To load and run a program, use the
"RUN" command followed by a filename.
+ To save a program, use the "SAVE" command followed by a
filename.
+ To list a program, use the "LIST" command followed by an
optional destination device ("D:file.lst", "P:"rinter) and an

option start and end set of lines seperated by (a) comma(s).
Examples: "LIST 10" to see line 10.
"LIST 10,20" to see lines 10 through 20.
"LIST 10," to see lines 10 to the end (TurboBASIC XL and
BASIC XL(???) only!)
"LIST "P:"" prints the listing to the printer. (Beware the
graphics characters will probably mess up the printout on
most printers!)
"LIST "D:A.LST",10,20" saves the listing of lines 10 through
20 to the file "A.LST"
2. Where can I learn Atari BASIC?
This file looks like it has moved or vanished! "Atari BASIC
Instructions"
(http://student.uci.agh.edu.pl/~tatar/Atari/Langs/abasic.html)
3. How do I quit BASIC?
+ Type "DOS" to quit BASIC and return to DOS.
+ Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari logo on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use
[HELP] to go to the Self Test when the Atari logo appears).
+ Reboot with [OPTION] held down to disable BASIC. (For
emulator users, remember there are ways to totally disable
BASIC.)
4. Why don't strings work?
Strings must be "dimensioned" (declared) like arrays in Atari
BASIC. Strings are special character arrays. See the BASIC
usage/etc. files mentioned in the answer to question 2. Simply
put, to make a string that will accept up to "#" character, use
DIM [name]$(#). Example: DIM A$(10) - now A$ can contain between 0
and 10 characters.
5. How do I make graphics?
Use the "GRAPHICS" command to switch between the following
OS-based screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of
40 x 24 x 2 sized text covering the bottom of the screen. Add "16"
to the mode number to remove this window (but do not make any
PRINTs or PUTs to the standard output otherwise a GRAPHICS 0
screen will appear!))
(Note: Add "32" to the mode number to keep the screen from
clearing when it appears. One problem, however, all screens
overlay each other so unless you only use certain modes at certain
times, parts of some screens will become (or start out) with
'garbage' on them.)

Atari OS Graphics modes:
+ GRAPHICS 0: 40 x 24 x 2 text
+ GRAPHICS 1: 20 x 24 x 5 text
+ GRAPHICS 2: 20 x 12 x 5 text
+ GRAPHICS 3: 40 x 24 x 4 graphics
+ GRAPHICS 4: 80 x 48 x 2 graphics

+ GRAPHICS 5: 80 x 48 x 4 graphics
+ GRAPHICS 6: 160 x 96 x 2 graphics
+ GRAPHICS 7: 160 x 96 x 4 graphics
+ GRAPHICS 8: 320 x 192 x 2 graphics
+ GRAPHICS 9: 80 x 192 x 16 luminence-only graphics
+ GRAPHICS 10: 80 x 192 x 9 graphics
+ GRAPHICS 11: 80 x 192 x 16 hue-only graphics
+ GRAPHICS 12: 40 x 24 x 4-colored text
+ GRAPHICS 13: 40 x 12 x 4-colored text
+ GRAPHICS 14: 160 x 192 x 2 graphics
+ GRAPHICS 15: 160 x 192 x 4 graphics

Atari BASIC Graphics Commands:
Commands available in Atari BASIC for manipulating simple graphics include:
+ PLOT x,y - plot a pixel
+ POSITION x,y - position cursor
+ COLOR c - set drawing color (c=color or character value)
+ DRAWTO x,y - draw a line from cursor location (set with "POSITION", "PLOT", "DRAWTO" or "LOCATE")
+ LOCATE x,y,r (where "r" is a varibale where result will be stored)
+ SETCOLOR c,h,l (c=palette location (0 to 4), h=hue (0 to 15, explained below, l=lum, 0 (darkest) to 15 (brightest))

SETCOLOR Hue Values:
This is a simple table of Atari's 16 hues. For now, I've just pointed out major color points. In-between values are in-between colors. (Since 1 is yellow, and 4 is red, 2 and 3 are oranges.)
+ 0 - black/grey/white
+ 1 - yellow
+ 2
+ 3
+ 4 - red/pink
+ 5
+ 6
+ 7
+ 8 - blue
+ 9
+ 10
+ 11
+ 12 - green
+ 13
+ 14
+ 15 - yellow

Colors:
Note: COLOR command colors are not identical to SETCOLOR command colors:
In 4-color drawing modes, all four of these colors map to the SETCOLOR palette locations:

+ COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
+ COLOR 1 will draw using color "0", set with SETCOLOR
0,hue,lum
+ COLOR 2 will draw using color "1", set with SETCOLOR
1,hue,lum
+ COLOR 3 will draw using color "2", set with SETCOLOR
2,hue,lum
In low-resolution 2-color drawing modes, these two colors map to
the SETCOLOR palette locations:
+ COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
+ COLOR 1 will draw using color "0", set with SETCOLOR
0,hue,lum
In the high-resolution 2-color drawing mode (GRAPHICS 8), and in
the 2-color text mode, (GRAPHICS 0 and the text windows), these
three colors map to the SETCOLOR palette locations:
+ COLOR 0 will draw using the background color, set with
SETCOLOR 2,hue,lum
+ COLOR 2 will draw using a color which is the luminence of
color "1" and the hue of the background (color "2"): SETCOLOR
1,anything,lum
+ SETCOLOR 4,hue,lue will change the color of the screen
border.
In the GTIA luminence-only graphics mode (GRAPHICS 9), the color
specified with "COLOR" is the brightness of the pixels you plot (0
is black/darkest, 15 is white/brightest).
+ COLOR 0 is the background color and pixel hue, set with
SETCOLOR 4,hue,0. Setting the luminence of the background to
anything but 0 causes strange things to happen.
In the GTIA paletted graphics mode (GRAPHICS 10), the following
colors are used:
+ COLOR 0 is the background color, which is actually
Player/Missile 0's color, set with POKE 704,hue*16+lum
+ COLOR 1 is PM 1's color, POKE 705,hue*16+lum
+ COLOR 2 is PM 2's color, POKE 706,hue*16+lum
+ COLOR 3 is PM 3's color, POKE 707,hue*16+lum
+ COLOR 4 is color "0", SETCOLOR 0,hue,lum
+ COLOR 5 is color "1", SETCOLOR 1,hue,lum
+ COLOR 6 is color "2", SETCOLOR 2,hue,lum
+ COLOR 7 is color "3", SETCOLOR 3,hue,lum
In the GTIA hue-only mode (GRAPHICS 11), the color you specify is
the hue of the pixel (see the "SETCOLOR" color table, above). The
luminence of the pixels is based on the value for the background
luminence:
+ SETCOLOR 4,0,lum Sets the luminence of all colors except
black, which remains darkest (black).
6. How do I make sound on the Atari?
The easiest way is to use the BASIC "SOUND" command:
SOUND c,p,d,v

+ c=channel (0-3)
+ p=pitch (0-255) (0 is highest pitch, sometimes off; 255 is
the lowest pitch)
+ d=distortion (0,2,4,6,8,10,12 or 14) (10 is a "pure" tone)
+ v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT
[CONTROL]+[G] like in MSDOS/Unix)
7. How do I move the cursor and edit?
The Atari "E:" device (standard input/output which is the
"editor") allows the following characters for editing:
(Note: "Sh" means "[SHIFT]" and "^" means "[CONTROL]")
Key: AtASCII #: Use:
---------- -------- ----------
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)

Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand.)
8. How do I make the editor characters appear?
As shown above, you must have an ESC sent before them.
+ When simply entering text, type [ESC] then the edit key and
the character for that edit key should appear.
+ When entering text in a PRINT statement (in BASIC, et. al.),
you must have it send an ESC beforehand, so first type
[ESC],[ESC] to make an ESCape character appear, then type

[ESC] then the edit key and the character for that edit key
should appear.
When the PRINT statement is executed, the first ESCape (which
you typed as two [ESC]'s) will make the editor SHOW the
following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit
key) will make that character appear. This makes it difficult
to align a set of PRINT statements which make a multi-line
picture or menu which uses viewed edit keys.
It is probably best to have all of the lines in your program
with the PRINT statements that can fit visible on the screen,
then edit them (without putting any of the ESCape characters
in, then when the picture looks like how you want it on the
screen, move the cursor to on top of each edit-key character
and press [Control]+[>] (Control-Insert). A blank space
should appear under the cursor and the rest of the line
should move right. Now, type [ESC],[ESC] and an ESCape
edit-key character should appear where the blank space was.
When you are finished doing that for each line with those
PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY
PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".
9. What's with the colors changing?
This is called "Attract mode" as was used on the Atari 8-bit
computers and the Atari 2600, 5200 and 7800 game systems. When a
key hasn't been pressed for about 8 minutes the screen colors
begin changing, thus protecting your TV or monitor from having an
image burned on it.
+ To turn this mode off, press a key, or, if within a program,
use the command "POKE 77,0" at least once every few minutes
(IF the screen is active, otherwise turning it off would be
kinda useless).
+ To turn it on, wait 7 or 9 minutes without pressing a key or
having location "77" set to "0", or set location "77" to
"128" with "POKE 77,128", voila! instant attract mode!
10. How do I access 'devices' in Atari BASIC?
The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
+ OPEN #a,b,c,d$
Opens channel 'a' for access to 'd$' in mode 'b' with
auxillary mode 'c'. Channel 'a' must be free or else a
'Channel already open' (129) error will occur. To explain the
different "modes", here are simply some examples:
o OPEN #1,4,0,"K:"
Input from keyboard
o OPEN #2,8,0,"P:"
Output to printer

o OPEN #3,12,0,"D:FILE"
Random access to disk
o OPEN #4,9,0,"D:DATA"
Append-output to disk
o OPEN #5,13,0,"R:"
Concurrent to RS232 (modem)
o OPEN #6,6,0,"D:*.TXT"
Directory access to disk (reads directory of "*.TXT"
mask; listing only files on the drive whose names end in
".TXT")
+ CLOSE #a
Closes channel 'a' (freeing it for use)
+ GET #a,b
Reads a byte from channel 'a' and stores it in 'b'
+ PUT #a,b
Puts byte 'b' onto channel 'a'
+ INPUT #a,b$
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores it in 'b$'
+ INPUT #a,b
Reads a string (up to 255 bytes and a REQUIRED 'end of line'
(character 155)) from channel 'a' and stores the numeric
value of it in 'b'
+ PRINT #a,[stuff]
Just like the normal BASIC PRINT statement, but sends the
information to channel 'a' (semicolons, comas, and mixed
types are of course allowed).
+ STATUS #a,b
Reads the error 'status' of channel 'a' and stores it in 'b'
+ XIO a,#b,c,d,e$
General I/O call. This a little complicated and may be
expanded upon in a future revision. Just be aware of the
following:
o a - command
o b - channel to use (usually must be free)
o c - auxillary mode 1
o d - auxillary mode 2
o e$ - file or device to act upon
Examples:
o XIO 32,#1,0,0,"D:FILE,OLDFILE" renames file
o XIO 33,#1,0,0,"D:OLDFILE" deletes file
o XIO 34,#1,0,0,"D:GAMES" creates a directory in My- &
Sparta-DOS
o XIO 35,#1,0,0,"D:NEWFILE" locks a file from over-write
and deletion
o XIO 36,#1,0,0,"D:NEWFILE" UNlocks a locked file
o XIO 40,#1,4,0,"D:PROG.OBJ" loads and runs a binary file
(like "L" in Atari and MyDOS)
o XIO 40,#1,5,0,"D:PROG.OBJ" loads a binary file (like "L"
in Atari and MyDOS with the "/N" option)

o XIO 41,#1,0,0,"D:GAMES" changes default directory that
drive/subdirectory (all calls to "D:" will now occur
within that drive/directory)
o XIO 254,#1,0,0,"D2:" FORMAT a disk (in Atari DOS 2.5,
this is format 'enhanced', to format 'single' density,
use XIO 253) (in MyDOS, this is format, but not
'enhanced', use:
o XIO 253,#[channel],1,0,"D[drive]:" for formatting a
drive in enhanced mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in
the "XIO 40" example.

-- Getting Atari files to a PC: --

1. How can I read Atari disks on my IBM?
Note: Someone please give more details or corrections here!
Thanks!
If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks.
Please see the Atari 8-bit FAQ for more details.
If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
then run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up on
your IBM.
2. Ok, I can't do any of that, now what?
+ Drive Emulators:
You can use SIO2PC or APE, which are programs for IBM's which
turn your IBM into a set of Atari disk drives. You need an
"SIO2PC cable" or something similar (which you can purchase,
assembled or unassembled, or buy parts and build it yourself)
and the SIO2PC or APE software (available at UMICH).
SIO2PC users: Connect your IBM to your Atari, load SIO2PC,
and then run the program FILE2PC on the Atari to transfer
files to the IBM's hard drive. Or instead create a disk image
within SIO2PC and copy files from one disk (a real Atari
floppy) to another (the SIO2PC image) with the Atari or MyDOS
"C"opy command. If you want to extract files out of the
SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC
or use S2PC, an IBM program which can extract files from or
add files to MyDOS-compatible SIO2PC disk images!
APE users: You can turn one of the 8 Atari drives into a

"PC-Mirror" drive, allowing access to save and load files
directly onto your PC's disks.
+ NULL-Modem:
You can use two modems (one on your PC and one on your Atari)
to download files from your Atari 8-bit.
+ FTP From Archives:
If you don't necessarily want files that you already have on
your Atari 8-bit, you can download files from the huge
collection available at FTP sites and Atari 8-bit supporting
bulletin boards and save them onto your IBM.
+ Using an online account for one-modem transfers:
If you have only one modem, so you can't connect both your
Atari 8-bit and your IBM together via modems, you can do it
via null-modem, OR you can upload files from your Atari to
some bulletin board or account you have access to, and then
connect the modem to your IBM and download the files.
+ How can I convert DiskCommunicator (DCM) files to and from
other disk image formats?
There's an IBM program out called "DCM2DSK".
There's also C source to a very similar program called
"DCMTOATR" which works on PC's (a PC executable version comes
in the archive) and Unix and probably any other system with a
good C compiler.

-- Where to get or FTP files mentioned in this FAQ: --

: do it on PeeCee.

What about de-compression? I mean, do you want to depack it on Atari using a special util (like UnARC), or would you add the depack-routine to an Atari executable so it'll automaticly depack and run when executed?

Superpacker may be the way to go, but it's hard to get in touch with Jiri Bernasek since he doesn't have an Email-adress....

: I don't know any packers. In the times I used real Atari, there were
: none available (AFAIK).

Packers have been around for a long time (like "the Cruncher" and such). Superpacker was released in 1998 I think..

Is there any activity at all on the mechanism when you turn
the drive on? Does the head move at all, or does the red LED on
the drive face come on momentarily?

Steve

5963. Atari XEGS Keyboard Cable Extension?

Newsgroup: comp.sys.atari.8bit

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be
listed.
Persons or entities holding rights to products, but not selling or
supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
```

developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be
sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright
notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Folks,

If I may be so bold as to ask your collective advice...

I am working on a display containing a history of home computing, and am looking for ideas on what to put in the various display cabinets.

The ones I would like some feedback on are the Atari 400/800 and VCS cabinets.

I'm thinking Combat, Space Invaders and Breakout for the VCS, and perhaps Star Raiders for the 400/800 display, but I'd really like to hear what you guys think..

Any ideas folks?

Regards,
Daz

Why not make one yourself? (If you have a soldering iron.) A couple of 15-pin D-type connectors (one male, one female) and a length of 15-way ribbon cable is all you need. Mine's about two metres long (!) and works fine...

My memories of the early 80's going to the comuter shops. Star Raiders was the beastie on Atari 400/800 that was always in the cart slot and always drawing the attention. Then we saw the price tags and all bought Speccies and C= 64s depending on our pockets. It was loud, brash and instantly pick-upable and drew the crowds. Proberbly the main reason I wanted really an Atari and why when the price dropped here due to the Dixon Deal I rushed out and bought one.

Silicone warriors took advantage of the 4 player ability and i saw it sometimes in display machines. Again loud, brash colourful and instantly pick-upable. But Star raiders was the demo king in the shops.

I notice Richard Kilpatric points to M.U.L.E. wich is a great game but i never saw it as a demo, also its not quiet a demo style game though it is also one of my faves. It doesn't quiet have the instant appeal of the simple and brash shoot-em-ups. The Lucasfilms Games and Mercenary also fill this catagory of being great involving games but not something you could pick up for a bit of Instant Gratification.

If this is a standard 15 pin sub-D, could you use an IBM PC joystick, or Mac monitor extension cable? One designed for 2 joystick should pass all the signals through.

The VCS by definition must be limited to games, but the 400/800 is a general purpose machine. Star Raiders was the most widely known recreational application and I would be hard pressed to select only one non-game app. 850 Express logged many hours on our system along with Speed Script and SynCalc and a lot of home made special purpose Basic programs. The 800 was a *real* PC, user oriented with emphasis on the personal in personal computer.

Well if you are adding some games in the display, I would put an Ultima
Game and Castle Wolfenstein in the Atari 400/800 case. Oh, Pacman
also.... That game is what caused me to get my orignal 400.

Well, for sheer "ooh, ahh" factor, we can't rule out things like
"Alternate Reality: The City," "Ballblazer," "Rescue of Fractulous,"
and the oodles of AWESOME demos which came out of Europe in the late
80's and early 90's.

Hard Software's "Cool Emotions" and "Joyride" are two good examples.
"Drunk Tank" is another great one.

"Fujispin" (aka "Swan Demo") and the "Robot/Spaceship" demo were actually
made by Atari for display units. :)

Here are some screenshots of stuff I had made once to convince a friend
how much cooler the Atari was than the Apple II :)

Well,
the problem is, I do not have any ST or compatible atari, nor the XL
Deejay. Some months ago I converted several ATR images to .DI format for
a friend (who uses the Deejay) using your ACVT program. He reported to
me, that none of these converted images worked, thus I concluded there
must be something wrong with your converter... I am sorry, that I cannot
give you any further details, maybe another Dejay user can...
-Andreas.

Message-ID: <3BBDCF7B.B728652D@mail.uni-mainz.de>
Source record: 33852

Well,
how many do you want ?!? And do you want only newer packers/unpackers or also older ones (called crunchers or bit/byte crunchers) ?? What about archivers (Arc, Alf, diskcom, LZH, ZIP, etc.) ?? Ok, to make things short, I am a collector and thus I have collected all packer programs I know on 2 medium/dual/enhanced density atari disks. Just e-mail me to get them. But beware: none of these packers have manuals, so you have to find out yourself how they work. in my opinion the DJ packers have the highest compression level and unpack automatically, but sometimes other packers are better or user friendlier...
-Andreas.

P.S.: If you really have problems, I can write some short docs how to use these packers (docs in english or german, not czech!!)...

Well,
did you use atari before 1982 ??? I have my doubts - since they were not
avaiable at that time in Czechoslovakia. But packers were avaiable from
that time on (and maybe even earlier). Ok, most of these "packers" were
simple archivers (like ALF, ARC, Squish, Shrink, Mash, and others) or
simple (bit/byte) crunchers (like the Compressor, the Cruncher, Super
cruncher, etc.). Afaik, Koala could not only compress pictures, the
routine could also be used to compress other data... -Andreas.

> What exactly is the difference between .COM .EXE and .BIN files?

Concerning the file format, none. ".COM" used to be the command
files (hence the name) of the Os A/+ Dos from Oss, the same
company that manufactured the Mac 65. This Os used the .COM
files whenever you typed in a command name on the command line
that was not build into their command interpreter; about the
only difference of the file format I remember is that .COM binaries
have to be started at the first load address, whereas typically
Dos 2.xx files need to define the start vector at $2e0,$2e1 to get
run at all. I've never seen any .BIN, though.

So long,
Thomas

5983. Re: File extensions?

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-05 17:03:13 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <lJlv7.3656$2p1.491831@newsread2.prod.itd.earthlink.net>
Source record: 33856

Originally .COM files used the file start load address as the execution point; they were normally called by their name typed at the command processor prompt. Often these were external components of the file management system or similar utilities and expected to find data in predetermined buffers and code or pointers present from a specific DOS version.

.EXE files used the Atari DOS 2.0 convention of appending a load segment containing the execution address to be placed into $2E0-1 or $2E2-3. Usually these were complete applications and were rarely DOS specific.

.BIN files in their simplest form were just binary RAM images of data or code; they were not intended to execute immediately after the load. Multiple load stages were possible, but typically no INIT or RUN address was included.

Do you have any of the following Atari Program Exchange software on disk?
The APX archive (http://www.atariarchives.org/APX/) has permission to
put these programs online, but I don't have a copy of these disks.

For the archive, I prefer complete disk images (in ATR or DCM formats) to
standalone .EXE or .COM files.

Message-ID: <3BBE0E72.477C591@ti.com>
Source record: 33860

I just downloaded the cc65 cross compiler for the A8. Does anyone know
if there are graphics and sound libraries somewhere, or has anyone
written
any functions to do graphics or sound?

I would like to try coding a few games in C for the A8. Does anyone
have
any pointers?

Thanks!

> know what memory adresses are free of conflict. Thanks

Safe bet would be to use the open spots in the existing hardware memory map.
Best choices are $D600-$D7FF. That would keep you fairly compatible to most
of the 8 bits and avoid most hardware conflicts with 3rd party vendors. For
instance, $D100-$D1FF is open in an 800, but used for parallel devices like
The Black Box and MIO in the XL/XE series computers.

Source record: 33862

Hi there,

I started on a 600XL with tape deck and Defender on cart.
Just as good as the arcade machine. Another early game
that I was hooked on was English Software's 'Diamonds'.
Moved onto an 800XL a couple of years later when
Dixon's did their deals.

It wasn't until the 8-bit market was almost dead that I got
a disk drive and also upgraded from using Atari's Assembler
to MAC/65. I wish I'd upgraded a lot earlier I can tell you!

The machine still holds a fasination at getting such a simple
computer to do such great things with Dlists, DLIs, VBIs etc.
IMHO, a bit let down (depending on which way you look at it)
by the hardware sprites when compared with the C64,
but POKEY does hold up to the SID (e.g. Draconus,
International Karate & Warhawk when compared, although
I don't think we could manage a Sanxion Loader or the
Last Ninja III Intro!)

Regards,

Mark

dh> hear what you guys think..

dh> Any ideas folks?

If you're looking to grab the attention of passers-by, "Encounter"
puts on quite an eye-catching demo when left alone for a while.
Noisy, too. Might drive =you= crazy after a while, though... I
believe "Enchanter" also goes into a busy demo if left alone, and is
quite visual as the wizard is planting and healing trees while
defending them from the invading spiders.

If you're looking for a classic nostalgic touch, then I second the
nomination for Star Raiders. MULE does have a demo mode where it
simulates a game between 4 computer players, but it is a strategy
game that is best played and not very exciting from the
sidelines...even if you love to play the game.

My only encounter with POKEY music has been through the emulator format
called PN, or PokeyNoise, much like PlaySID. And that was a real let-down.
It sounded monaural and simple, like a PC bleeper.
Are there are any titles to look out for in particular which would
demonstrate the true abilities of the POKEY?
I've yet to see a "chip" chip which beats the SID, but my experiences with
PN haven't even lived up to the mediocre standards of the AY-3-8910.

: demonstrate the true abilities of the POKEY?

Numerous, but on an emulator they all sound bad. I don't think you ever heard
a Music ProTracker song on a real Atari. Leaves the SID far behind...

>cart slot and always drawing the attention....

That and Pac-Man....not to mention Defender when that appeared.

>....Then we saw the price tags and all bought Speccies and C= 64s
>depending on our pockets.

Having been burned by Sinclair twice in the form of the ZX-80 and ZX-81 I refused to buy the Spectrum - a decision I have *NEVER* regretted!

Back in those days the C64 was a non starter in my opinion....it just wasn't as technically advanced as the Atari nad didn't have the kudos of the Atari (besides, why play inferior ports of Atari games when you could play the real thing?).

>....main reason I wanted really an Atari and why when the price dropped
>here due to the Dixon Deal I rushed out and bought one.

You too eh? ;-)

Still have my original 400, in the original box even....

>....The Lucasfilms Games and Mercenary....

Never got too excited by Mercenary myself to be honest (though I did play it all the way to the end, several times). My favourite Novagen game has to be "Encounter".

Tricky one, there were SO many great games for the Atari.

I think you should consider the following in addition to Star Raiders (in no particular order):

Encounter
Galaxian
Repton
Defender
PacMan
Drol
GridRunner
Bandits
Robotron
Dropzone
Choplifter
Joust
& BallBlazer

You might also want to look at http://www.bitsofthepast.com/atari/ under the Pirate's Treasure Chest. There's an excellent sector editor included in that package that I used to use to copy a ton of stuff that wasn't supposed to be copyable. I also used it to deface many Atari games to my own liking. Atari Basketball looked great with my high school's name instead of "HOME". Frogger became Roadkill, Donkey Kong became Konkey Dong (you get the idea).

In the realm of TRS-80's there was the Orchestra-85 (model 1) and Orch-90 (model 3/4). Excellent sound - 5 voices in stereo. It was an add-on cart for the color computer and a plug in module for the others complete with left/right RCA speaker jacks. Built in amp. I recall that there was a SIG on compuserve that kept an archive of songs for download. Was an Orch player ever released for the Atari? The song files were extremely simple text files that were very easy to script. Listening to it play with your eyes closed, you'd swear it was a yamaha electric piano in front of you!

As long as we're strolling down memory lane here...

My first computer was actually a TRS-80 model 3 (my dads 'business' machine). He became extremely frustrated with me hogging it all of the time, so he decided that he would get me an Apple][. Well fortunately for me there were no Apple dealers to be found in the Galveston area. It was then one Saturday we went by Sears and spotted the Atari computer area. I came home with a brand new Atari 800 complete with a 410 and an Eastern Front cart. I set it all up and literally spent hours just making the Eastern front screen move around with my joystick. Who would of thought! A computer with bright colors, joysticks, and a screen that moves around! After 2 years of staring at the TRS-80's black and white screen, this was a miracle!

Talking about sectoreditors... Try "Happy Master Quad+". Excellent tool with all search & edit features you'll ever need, all in Hex, Dec, Asc and Int formats. Supports DOS 2.x sector-links, Single, Enhanced and Double density and has a colorfull screen which is much easier to view then all those 2-color editors (when using a color-monitor ofcourse :-))

I'll try to put a copy (LZH archive) in alt.binaries.comp.atari8bit for those who're interested...

Mostly for telecommunications, at first; they allowed modem transfer of a boot disk possible. They also add convenience when you want to transfer a package containing the .exe file along with the .doc, .cfg, .dat, etc. files.

Uhm.
I think you asked for this before, so I guess you didn't get a response.
It would help if you said some more about the program.
You say it comes on disk, so I guess it is a boot disk program,
not one of Antic magazine artilcle/program. I did a quick check
of the old 'catalogs' in a 1988 Antic and didn't see anything.
Antic sold programs, so I guess you're looking for one of them.
I found nothing at the Antic Site (Kevin Savitz).
http://www.atarimagazines.com
I'm thinking of 'Tricky Tracks', but that was a BASIC program,
not from Antic, not a boot disk.
There are lots of 'Tips and Tricks'. How about a description of
'The Trick'.?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Hi everyone!

I'm an Atari 8-bit enthusiast user from Chile, South America, who wants to salute the whole community.
Now I'm programming a little puzzle game in assembly, but very challenging. I think I will finish it as soon as possible, when my university leaves alone for a while :)
In the past, I fixed some games with PAL-troubles, like Rockman, Thinker, etc. If anyone wants a copy, please email me and I will send it.

By the way, did you know that the game "Line Up" has some tricks? For example:

1) Boot the game in NTSC mode. You'll see an special intro.
2) Press SELECT during the boot.
3) Press the INVERSE (or ATARI) key during the special intro.

I think it has more tricks, but I didn't find them yet.

Greetings to all Atari 8-bitters!

Guillermo Fuenzalida
gfuenzal@cec.uchile.cl

Source record: 33893

Uhm.
I have BXE 4.1. It gives the version at the Ready.
I have SDX 4.20.
I think my ACTION! is 3.6, $B000 has a hex $36.
My Mac65 is 1.0
The RT8 has no ROM in it, I don't think, but I dunno.
These carts, like any cart I think, are EPROMs, if I think
they can be burnt with the right equipment and chips, but
that's a little advanced. They don't have a 'burnable' EPROM in them.
But you probably already understand this better than me, Jindroush.
My ACTION! wouldn't work. I did the eraser thing on the
contacts and it worked. These are getting old. Carts are subject
to failure and nobody is making these OSS/ICD/FTe carts any
more, I think. Uhm.. Lemme see Lance Ringquist/Video 61 makes
carts and has a relation to Bob Klass and the FTe stuff. Maybe
V61 can make new OSS carts.
Russg

It's a BASIC public domain program (#918), from the Lake Almanor Public
Doman (the address is on the label, if anybody wants it). The program
modifies certain commecial games (giving you unlimited lives, etc.- a sort
of 'Game Genie').

6018. ICD/OSS cartridges

Newsgroup: comp.sys.atari.8bit

Hi,

Does anybody remember, if the following cartridges were sold in box? Do they have the subversions printed on labels? Was it possible to have them 'reprogrammed'?

Basic XL
Basic XE
Action
Mac/65
SDX
R-Time8
Writer's Tool

I'm also looking for the owners of following cartridges: Action other than 3.6, Basic XL 1.00, 1.02, Mac/65 1.00, SDX other than 4.18, 4.22, Writer's Tool. Please, contact me.

Mercenary was probably responsible for the most wasted hours/days during
my Atari era, but Encounter used to scare me shitless! When the 'ball'
finally hit me, I never failed to jump out of my skin. Kind of like
whenever the alien pops up on your windscreen on Rescue On Fractalus -
Literally gave a girly squeal first time that happened to me! :-)

Okay, I've got the roms for SDX 20,21 and 22. When I got my SDX it didn't come in a box, just plastic wraped with the book.

I guess all I've got is the last versions of Action!, Mac65, BXL and BXE ... though when I first got my copies of Action! and BXL, they came with the 9" yellow three ring binder.

The Version of WritersTool I've got is 2.2 ... it also come with the 9" yellow binder and disk.

This would be Utopia: the creation of a nation. I don't know about the Intellivision release.

I can't seem to get the copy I got working on any of the emultors I have tried. Does anyone know where to find a program to write images to Atari floppies on a PC?

6029. Update to the Westfront PC Translation Project :)

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-08 07:48:34 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <7a1fd8df.0110072348.3bf82d82@posting.google.com>
Source record: 33703
Cross-posted to: comp.sys.apple2,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.sinclair,comp.sys.amiga.games

Hello,

For those interested, I have been working feverishly to produce a
version of Westfront PC: The Trials of Guilder for the following
platforms:

Apple II/IIe
Commodore 64/128
Atari 400/800
Sinclair
MSX
CP/M 2.2 and above
Commodore Amiga
DEC Rainbow
Acorn
Palm IIIc
Amstrad
Atari ST
Apple Macintosh
TI 99/4A

Since the game itself is already ported to MS-DOS and
Windows-compatible computers, playing it shouldn't be all that
difficult:

http://www.geocities.com/dunric/westfront.html
(or an alternative link to)
http://members.tripod.com/~panks/westfront.html

I believe this game is possible to port to any of the platforms listed
above, although each version would have to be suited to the individual
system's capabilities. Since the game was coded in a flavor of BASIC,
it shouldn't be too difficult to port to those systems:

http://www.geocities.com/dunric/wftrans.html

I have tried using UBASIC, PowerBASIC, ByWater BASIC, Chip Munk BASIC,
GFA BASIC, and a host of other interpreters/compilers but few seem to
handle the game in even the MS-DOS size.

Therefore, I am calling upon all programmers proficient enough in the
BASIC or C language that are willing to port a version of the Trials
of Guilder for their specific systems to write me at: dunric@yahoo.com

The reward is nothing more or less than a playable version of the game
on whatever system it is attempted to be ported to. The best method I

can think of is to write the data files for the game to disk and to keep variables and arrays to a bare minimum. Verbs can be cut down to a minimum of 14-18, depending on the system. Nouns in the game...well...use your imagination. :) If there are fifteen different swords and shield and helmets, that's probably too much.

So to aid in the translation efforts, I have compiled a "bare bones" list of the items and monsters available in a "minimal" version of Westfront PC: The Trials of Guilder.

Here's the list:

VERBS

GO,GET,WIELD,UNWIELD,WEAR,REMOVE,DROP,KILL (or
ATTACK),BUY,SELL,PUT,READ,EXAMINE
LIGHT,USE,EAT,DRINK,INVENTORY,LOOK,CLIMB,SCORE,SAVE,QUIT

(23 or so verbs)

ITEMS

BAG
LANTERN
FUEL
ROPE
GRAPPLER (a grappling hook)
NOVEL
SCROLL
KEY
IRONKEY
HELMET
BOOTS
FORCEBOOTS
SHIELD
ARMOR
CLOAK
ROBE
RING
CHAINMAIL
SHROUD OF SAINT NEPHAN
DISC OF ATHENS
GLISTENING ANKLET
ORB OF TRUTH
SPELLBOOK
KNIFE
DAGGER
SWORD
LONGSWORD
BROADSWORD
SLAYER
HOLY MACE

```
GLOWBALL
SCEPTER
TORCH
SHOVEL
MATCHES

(35 or so items)

MONSTERS
--------
SKELETON
CLERK
DRUNK
VILLAGER
VETERAN
BARTENDER
FALDOR
WOLF
WARRIOR
MONK
ZOMBIE
GOBLIN
TROLL
PALADIN
WRAITH
BEAR
DRAGON
BARBARIAN
THIEF
INSPECTOR FUNKYDOG
JESTER
SORCERER
SPIDER
ELF
HOBBIT
WIZARD
GUARD1
GUARD2
GUARD3
GUARD4
NINJA
SENTRY1
SENTRY2
SENTRY3
SENTRY4
CENTURION
ADVENTURER
SENATOR
BISHOP ROLAND
SOLDIER
```

(40 or so monsters)

Now for the room total. I've thought a great deal about this and I realize that the original room total of 1,728 (across 4 continents) is just way too much for most systems to handle. So I've decided a good number to try for would be between 200-300 rooms. A lot can be packed into each room, including multiple descriptors and other events.

Quests: Quests are entirely optional and may be included at the whim of the programmer. It may be as simple as "Rescue the princess from the dragon" or as complex as "Destroy the evil army, save the city, and return the enchanted goblet to the city of ankahan."

Let me know if this sounds like a good idea. I feel this game could be a fun experience for all involved.

Regards,

Paul Panks
dunric@yahoo.com

Only if your PC has a 5.25 *and* your A8 drive is true double density. I use AtariLink by HiasSoft to put the .ATR or .XFD image on a DD MyDos disk and a home made utility to convert the image to a real A8 disk.

--
-Ron

Experience is something you don't get until just after you need it.

How long is it before you /stop/ waiting for the alien with your heart
pounding, and cease to be startled at least?

(I first played it in 1988, and wouldn't play it for 3 weeks after the
first Alien - I got too stressed!)

Hi.. from USA, North America !!! :) I am an Atari 8-bit and a Commodore C64 user. (a 6502 user ??)

> Now I'm programming a little puzzle game in assembly, but very
>challenging. I think I will finish it as soon as possible, when my
>university leaves alone for a while :)

When done... put it on a website and post a link to it... I'd like to try it out...

> In the past, I fixed some games with PAL-troubles, like Rockman,
>Thinker, etc. If anyone wants a copy, please email me and I will send it.

I have tried to NTSC fix a few games on a C64.. not an easy task. I was much better at "cracking" the copy protections.

> By the way, did you know that the game "Line Up" has some tricks?

We gave these "tricks" a name.. we call them "Easter Eggs"... you will find that quite a lot of programmers on most platforms hid little "surprises" in the software. Maybe you know that already....

Anybody ever find the one in Internet Explorer v4 (mine is v4.72.3110) ??

I list a few for the C64 on my website under "gaming" then "Hidden Demo Parts"...

Well... got to go...

"see ya"... ;)

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 10/09/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 2.00 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 7.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 7.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 7.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the
U.S. are also accepted (postal money order, PayPal or cash only!)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

A 5.25" drive in the PC wouldn't be useful, because the Atari has a 3.5" drive.
It is an Atari 1040 STFM.

Hello all....

Got the itch for some classic gaming. Just downloaded the new emulator,
XFormer 2000, and the game Alternate Reality to play with it. Now I don't
know what to do next! How do I get the game to load and start up?

Any step-by-step help appreciated.

Derek

6041. Minigame competition - Time to start voting

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-09 22:47:17 UTC
From: gasman@raww.org.RemoveThisBit.invalid
Message-ID: <9135F43D7gasmanrawworg@163.1.2.7>
Source record: 33715
Cross-posted to: comp.sys.sinclair,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.amstrad.8bit

The full pack of entries for the Minigame competition is now available from the Minigame website, http://demo.raww.net/minigame/ . There are 30 games in total, covering the C64, Spectrum, Amstrad CPC and Atari 8-bit platforms. So, you're now invited to vote on the games, and decide on a winner...

Voting is open to everyone, including the authors of the games.
There's just one catch - to take part in the voting, you'll need to play and rate all the games, for all four platforms. The voting pack includes instructions on using emulators, though, so that shouldn't be a problem.

I'd like to take this opportunity to thank everyone who took part in the competition, as well as those who've taken the time to promote it - thanks to your efforts, the competition has been a real success, and if all goes well, I hope to repeat it next year.

Matthew Westcott

6042. Atari 1050 Disk drive replacement head pads

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-09 23:35:09 UTC
From: dragonadventure@hotmail.com
Message-ID: <67ebc6b4.0110091535.7d5cfa02@posting.google.com>
Source record: 33716

Hello. I've been using my Atari 1050 a lot since I've made an APE interface cable for it. But now I'm noticing I'm wearing down the drive head pad above the read/write head inside the 1050. It rests above the magnetic coating of a disk when one is inserted. The only remedy I can think of is to replace the pad with one from a Commodore drive.

Does anyone know if I could make replacement pads using simple materials? I suppose finding someone who sells pads is hard enough.

Hi,

> Mercenary was probably responsible for the most wasted
>hours/days during my Atari era....

IKWYM, I didn't mean it to sound as if I didn't like "Mercenary" (I wouldn't dare, I did the title screen for it), rather that it never excited me the way a good arcade shooter does.

>....but Encounter used to scare me shitless!

That's the way I like my games: fast, furious, no time to think....probably why my all time favourite is Tempest 2000 on the Jag.

TTFN - Pete.

6045. Trading Atari carts for ANY system carts!

Trading Atari carts for ANY system carts!

My trade list is below. If you are interested in anything, email me (erradik8@aol.com) and let me know. If you email me, please also attach or include your trade list. I am willing to sell if you have nothing to trade. I collect ALL Sega, Nintendo, Atari, Colecovision, Odyssey, Playstation, Turbografix, Neo Geo and Commodore 64 systems, games, and accessories. If I have not traded with you before, it is preferred that you send first.

Video game Trade list (2600, 5200, Jaguar, NES & Colecovision):

ATARI 2600
Adventures of Tron
Air-Sea Battle
Armor Ambush
Asteroids
Atlantis
Berzerk
Brain Games
Breakout
California Games
Carnival
Centipede
Combat
Cosmic Ark
Defender
Demons to Diamonds
Donkey Kong
Donkey Kong Jr.
Dragonfire
E.T. The Extra Terrestrial
Fire Fly
Football
Frogger
Frogs and Flies
Galaxian
Grand Prix
Haunted House
Ice Hockey
Kangaroo
Keystone Kapers
Lock N Chase
Maze Craze
Mario Bros.
Missile Command

Moon Patrol
Ms. Pac Man
Pac-Man
Phoenix
Pitfall!
Popeye
Raiders of the Lost Ark
Sorcerer
Space Attack
Space Invaders
Star Fox
Star Voyager
Super Breakout
Super Challenge Baseball
Super Challenge Football
Swordquest: Earthworld
Tron: Deadly Discs
Vanguard
Video Olympics
Video Pinball
Warlords
Word Zapper
Yars Revenge

ATARI 5200
Joust

ATARI JAGUAR
Blue Lightning (Jag CD)

NINTENDO NES
Blaster Master
Mike Tyson's Punch Out

COLECOVISION
Donkey Kong Jr.
Ladybug

6046. Westfront PC Explained: The Author Speaks Out

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-10 04:09:25 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <7a1fd8df.0110092009.101948f5@posting.google.com>
Source record: 33718
Cross-posted to: rec.arts.int-fiction,rec.games.int-fiction,comp.sys.cbm,comp.sys.apple2,comp.sys.atari.8bit

Dear Interactive Fiction Enthusiasts,

I wish to discuss with you the nature of my game "Westfront PC: The Trials of Guilder". It has been called a cross between Zork, Hitchhiker's Guide to the Galaxy, Star Wars and several online MUDs (Multi-User Dungeons). I am very humbled by such a mixture and am warmed to the heart by the kind praise and words of encouragement.

Westfront PC (or simply, "WFPC") is not meant to be a traditional text adventure game. It was inspired by a host of adventure games, from Zork to The Pawn to online MUDs and even some Graphical Adventure games. It is an odd mixture to say the least. But the truth of the matter is this: Westfront PC is half adventure game, half an inside joke and the rest eccentrically fun nonsense.

The game itself has 1,728 "rooms" spread across four different continents. But the fun of the game is not so much exploring the rooms as it is discovering new items and solving the various puzzles and quests around the game.

Strange events such as a "mysterious voice" that bellows odd phrases to the now infamous "Inspector Funkydog" spice up the gameplay. The pleasant use of color in the text allows for easier reading and better sense making.

Gameplay is straight forward: Solve 25 quests and defeat Salin's Evil Army. Sounds easy, right? Along the way, make new friends (Faldor, Wolf, Warrior, Zombie, Barbarian and Leopard) and discover new worlds (Burton Mansion, Hambley Abbey) in your quest to restore order to the mythical land of Guilder.

I coded Westfront PC on the Commodore 64 in 1994, which isn't saying much, other than that I tried to limit myself to the capabilities of the system. Soon after that, I ported the game over to the IBM PC-compatible line of microcomputers. And the rest, as they say, is history.

I am currently working on a whole new text adventure in the more traditional lineage, similar to Zork and Castle Adventure. My goal isn't to surpass Westfront PC...it is to create a whole new adventure game with different worlds to explore and much better room descriptions. If I receive even one positive feedback, I believe I will have succeeded in my goal of publishing an adventure game others find enjoyable.

Thank you for listening. :) Have a nice day!

Regards,

Paul Panks

Decent DirectX drivers??

Seriously though, ZX32 used to run full speed on my P200. Try turning of
the anti-alias effect as that can slow it down significantly if your
graphics card is a bit pants.

My graphics card is plenty fast, thankyouverymuch. I think it was just
acting up, tried it again and it played nice and smooth.

AC> I did *mean* to enter. Honest guv'nor. No really I did. I'll make
AC> it up somehow.[1] Still I did promote it as much as poss I
AC> s'pose...

The results clearly show that the C64 rules the scene and that the
speccy is crap. 21 entries for the C64 and a measly 6 for the speccy,
and I won't even get into the game quality. Prepare to eat 8-bit dust
in the next css vs csc flamefest.

6053. HELP: Need to Identify this Atari Game

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-10 23:36:25 UTC
From: Jedi1200@msn.com
Message-ID: <271557dc.0110101536.3aee35b8@posting.google.com>
Source record: 33727

Hey Public, I've been trying to remember the name of this old Atari 8-bit game that I played when I was younger. I think it was released in the mid to late 80's, but I only remember a little about the game. Here's what traits I remember:

- Fantasy-based genre with some RPG characteristics.
- The interface point-of-view was 3D, much like the games "Zombies" and "Crystal Castles".
- The rooms in the game were different names for Hell, such as: Pits of Gehenna, Ethereal Plane, Tartarus, and the Mines of Minos.
- You had 3 spells to cast during the game: Confuse (monsters have random movement), Freeze (monsters stop moving), and Protect (monsters touch inflicts no damage).
- When you made contact with a monster while unprotected, you heard an electric zapping sound that would last for the length of contact and your Health (Life, HP, etc.) would decrease.
- Some of the monsters were little rolling black balls, and some were zombie-like creatures.
- The object was either to collect things or escape, since the monsters could not be killed.

I might even be talking about the game "Zombies", but I'm not sure. If anyone can think of the name of this game, I would appreciate it.

Thanks in advance to all.
Jedi1200@msn.com

Greetings,

I am trying to build a online computer museum where all the machines will be decked out to the full glory of the era then put them online via Ethernet or a Terminal Server. What I'm asking for are your machines.

I got the bandwidth capable for this project. All machines will run either Unix Variants or a BBS program made for that particular operating system. (IE: GBBS or Futurevision for the Apple, CNET for Commodore 8-Bit and Amiga, Carina for Atari 8-Bit, Oasis or Forem for the ST, etc...)

Since all my money is going into providing bandwidth, electricity, space, food and related items (hey.. it takes supplies when you're doing something this geeky).. I can't pay for the machines. However if you're just going to junk them out anyways, why not see it gain a new life?

Send all replys to usenet@tripz.tv

Thank you - Don

Maybe not.. but there are those who have "excess" to their needs. For instance, I ran Terminal Frost BBS on my 320k 130XE with Bob Puff's blackbox and 130 megs of drive space on a Courier 9600 HST. But then I sold my machine to a well known trader (Jacey Squires if you remember him :)) and now.. 10+ years later.. I'm kicking myself for doing such..

If i can get the basic stuff, there's no doubt that I will be upgrading it again.. finding a MIO or Black Box or using SIO2PC and hooking it to my terminal server running Carina // filled with all the games from yesterday (Like robowars?)

I guess it kinda depends on what it's worth to the community as a whole. BBSes of the 8-bit era are pretty much gone into the wind. But wouldn't it be nice to revisit a site using that old ATASCII graphics?

I am not sure the ST can even receive data thru the printer port. I'd check the PF connector and make sure it is parallel and not serial., cause it might be a null modem cable. If it really is parallel, then you'd need to find software for the ST for it.

A Parallel xfer cable will have a DB25 M connector on both ends.

If one end has DB25 M and the other is centronics, then its for the printer.

Mercenary was one of my all-time favourite 8bit games. I think I
played it for almost 2 days solid (maybe 6 hours of sleep between
them) until I beat it. It was soooo far ahead of anything I'd seen on
the Atari until that point.

Does anyone know what the 3 ways to escape the planet were? I
think I found 2 of them but I never got the third.... Except I can't
remember now what the first 2 were.

> >....but Encounter used to scare me shitless!

Ballblaster/Ballblazer could get _very_ frantic too, and there was
a racing game called 'Elektraglide' from English Software that was
superfast and very much in the 'Encounter' mode.

Hi,

A terminal server looks nice, it could recieve calls so I can access a BBS,
but what about calling out? This is needed for networking like BBS Pro!
does. I still run my board on a telephone line, but also want to move to a
connection like the terminal server.... But I need a two-way connection...

Source record: 33741

Terminal Frost BBS was the name of my bbs. It ran at one time TOSAMIS then moved to Carina //.

Nope.. It doesn't need to call out.

The session goes like this:

You telnet into blah.blah.blah.blah

It routes to the terminal server.

Terminal server realizes someone telnetted into it and raises DTR/CD

BBS on the other end is watching for this to happen (remember in the days before Auto Answer in modems?)

BBS then sends login information to the terminal server then to you..

You log in..

Connection established.

Ok.. lets take this to the next step... Dialing out..

Now you can create terminal servers out of DECServers or any of the old school stuff. But you can also program linux or windows to emulate a modem when DTR and CD are raised to "on" status.

Then the program on that end would present you with the HAYES "AT" command set. It then interprets what you're trying to do "via ATDT xxx insert a ip address here" the program doesn't care about telephone numbers at that point.. it could even be a quick dial list programmed like atdt 1 dials 128.0.0.1

Then on the otherside if need be you can connect to a bbs just by passing telnet information from the above prescribed method. Then it will network just like the old days. Just over IP.

If Ethernet and TCP/IP was simpler to do on a 1mhz 8-bit machine instead of hogging up all that machine can do then it would be no problem.. just telnet into that machine.. however it can't unless you massively overclock that machine.

I am one step ahead of you. I have just put a Carina II BBS online (running on a real Atari 130XE and accessible via telnet) that has several classic online games including RoboWar II and Zenobia. I am in the process of beta testing it but it should be open to the public very soon.

Hi,
I have just acquired a couple of Atari 2600 PAL releases, and before I
auction them I wanted to know if PAL games work on an NTSC system...

I have;

Xenophobe (Boxed with Instructions)
Klax (Boxed with Instructions)

Does anyone know if these will run OK on an NTSC system?
Cheers,
Paul

I understand NTSC may be playerble on Pal systemd (NTSC has less scan lines and a higher frequency than pal) if you can alter the rolling. Other way round, I belive there is no easy fix.

One thing i have heard off was a hardware hack that sent the signal through as an S-Video/Scart/Peritel signal. But I'm not sure if it ever came to fruition on the 2600.

Well, I had PAL Asteroids and also Moon Patrol cartridges, and to play them in
NTSC only had to adjust the vertical similarly... compresing the lines, I
guess.

Elekraglide was always a graphics showcase whenever Spectrum owning
mates came round, but it annoyed the hell out of me - So frustrating
whenever you so much as touched the side walls, you'd lose all momentum
and have to start gradually accelerating again. Annoying!

Who remembers Rally Speedway? A precursor to Micro Machines, but 15 or
so years earlier. With it's course designer, and it's two player setup,
that was a brilliant racing game!

Hi everyone

I spent several weeks (days & nights) playing Ultima IV on my Atari 800XL (stealing time from my high school studies) back in 1985. I still remeber the music theme.

Now I'm playing it with the emulator Atari800Win on my PC, but I don't get any music. The sound effects are all right (when you move around etc.) but the music isn't there.

I've tried other emulators too with the same result.

I'm I doing something wrong or what?

/Tristan from Stockholm

I don't know, but AFAIK Ultima IV for the PC was released 'free'
on Origins site some time back. Maybe they still have it and you
could use it instead?

Well,
I have a so-called "UPN-calculator simulator" (maybe RPN is just a
typo?) and if I search deep through the Pooldisk Too (which takes some
time!) I would be able to find Tac Trek, Space Trek, Mankala, Fig forth,
Centurion, Ringmaster and a few others. Searching will be difficult,
since a lot of these programs do not have a directory and on the
Pooldisk Too they are stored as ATR images into subdirs like "Bellcom",
"Space", etc. and just have numbers (001.ATR, 002.ATR, etc.). Thus, I
have to boot or download every image that does not have a directory and
see if it fits your needs... -Andreas.

Well,
whats the use of any packer ?!? To save space !! So, if you wanna save some space on diskettes, you may use an ML packer, which automatically unpacks the packed ML file (thus the COM, BIN or EXE file is still runable). On tape recorders you also save time, since the loading of a packed program does not take so long (especially when it automatically unpacks, which takes only a few seconds, as we have seen in many polish demos and games). Next, if you want to store your Atari programs on a mailbox or another computer, a packer or archiver is a good choice therefore. In the old mailbox days there were no emulators avaiable, thus you had to archive your programs (especially bootdisks had to be archived as files, since a harddisk does not like bootdisks). Just my personal thoughts... -Andreas.

Yes, I have that on cart somewhere in my attic.

A great two-player game, as far as I can tell Micro Machines was
completely 'inspired' by it. There was no doubt that the 8bit was
the premier machine for gaming in its day.

Too bad abysmal marketing and high cart prices prevented it from
taking its rightful place as the top machine. Everybody just bought
Spectrums which had games at 5 quid a time, and used tape to tape
machines to copy them 20 at a time onto C-90 tapes for friends.

Then later the C64 came out and combined most of what was good
about the Atari (gfx, sound, US games library) along with cheap,
easily copied UK made tape games like the Spectrum had. Amazing how
even at that early stage, Atari proved itself incapable of making a
success out of technically superior products.

It's almost impossible to see how they could drop the ball as the
console market leader with the VCS2600 when they moved into home
computers, but they really did.

: > Pretty much gone, but not all of them. Mine is still running on Atari

: What kind of traffic do you get?

Very little traffic. Only a few calls a month. Since I lost track of the
other Pro!-boards, the mail will not be networked anymore to other
Pro!-boareds, except for one a few kilometers away from here. I'm searching
for some MUX cartridges to add an extra 130XE to run a second node which I
want to connect to the internet.
Have just set-up Red-Hat linux on my laptop to learn it a bit since I don't
know much about linux, and when I'm more comfortable with it, I'll get an
extra PC to run Red Hat on it and something like a telnet-gate...

Would like to run a TCP/IP stack on the Atari, and I know people are working
on it, but unfortunately I think I'll never be able to run both the BBS-core
and a TCP/IP stack simultaneously on the same computer, since there is almost
no memory left (apart from banked memory, swapped memory, and overlays) on the
BBS system...

Andreas Magenheimer wrote

: Well,
: whats the use of any packer ?!? To save space !!

Another, less important, reason: A packed file is loaded quicker from tape..
The depacking process is much faster than the loading process, especially on
a standard 1010/XC11/XC12 :-)
And as a bonus: Packed software is more difficult to hack. It doesn't cause a
real hacker too much headaches, but the lamers way of editing the intro-text
with a sector-editor is not possible this way cause the crc of the file will
not match, so the program will not run anymore...

Hi,

> Besides the 1020, 1025 and 1027, are there any printers that
>actually made it to market that will work with the 800XL? How
>about from companies besides Atari.

In addition to the ones mentioned thus far, both Epson and Star also made printers which could be connected directly to the Atari serial bus.

Rather than having a standard Centronics interface built in, these printers had a plug-in "interface cartridge". When you bought the printer you selected the appropriate cartridge for your system, be that Atari, CBM, standard Centronics, RS-232 etc....

I THINK the Epson LX-80 fell into this class, though the memory is a little hazy after all these years.

TTFN - Pete.

Does anyone know about a way to make use of 1050-2-PC (aka Prosystem)
cable under Windows 2000/XP?

I'd really love it if support for this cable was impletmented in
Atari800Win Plus: we'd be able to load atari disks right into the
emulator.
I recall (correct me if I'm wrong) it that was implemented in
PCXformer for DOS.

Calagan

Evening!

Last night while having a few a friend of mine and I had a go at "Dan Strikes Back". It was quite a lot of fun but, for the life of me, I can't remember the title of its predecessor. IIRC, the name "Dan" was't part of it.

Any takers?

Close; XFormer used its own cable which connected to the PC parallel printer
port and was not compatible with the APE/SIO2PC types.

Normally limited to 16K non-bank-switched carts. It allows copying the ROM code to a disk file which can be loaded into same address space RAM on a 48/64K machine. The switch on their cart can toggle a line to make the RAM appear to be ROM to defeat the protection in many carts of that era.

Works with 8k or 16k cartridges, but not the later bank switched ones.
Believe it also requires software on disk to use.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Quest for the maltese chicken & Orb of zarimer (spelling may be wrong on this one)

I had these and may have sent them to others in the group a while back but I lost my collection on HD after a crash.

These are pretty rare, both were published in semi limited amounts by a UK software mini company called Futureware, this company also made Sidewinder and a Uridium clone written by Noel Daniel.

Trying to find them as I helped get Maltese Chicken published and also had a hand in pointing the author of Orb in the same direction.

Both definitely got put on multi-boots so would have been spread around.

>between them) until I beat it....

I must admit to having done that myself too....even though I was never a
particular fan of adventure type games.

>....It was soooo far ahead of anything I'd seen on the Atari until
>that point.

That's probably what did it for me too, it was technically brilliant IMHO.

Did you ever play the "sequel"....errm....the name of which escapes me?

> Does anyone know what the 3 ways to escape the planet were?

Been too long, I can't remember ANY of the ways to escape now....I do recall
that I only found two of the escape routes too though.

Wasn't one via a ship located in an underground hangar?

TTFN - Pete.

>as the console market leader with the VCS2600 when they moved
>into home computers, but they really did.

Personally, I consider the 7800 to be the biggest lost chance to dominate the market that they ever threw away.

The decision to shelve the machine for so long (5 years in the case of the UK) was positively criminal - it's almost as if they wanted the company to fail.... :-(

TTFN - Pete.

Hi Andreas,

> whats the use of any packer ?!? To save space !! So, if
>you wanna save some space on diskettes, you may use an ML
>packer....

True, but I really don't see the point on a machine like the Atari.

In all the years I was using the various 8-bit machines as my workhorse systems I never ran into a situation where a packer would've been of benefit to me. After all, the programs were usually quite small and loaded quickly anyway (even on unmodified 810's and 1050's) - and with diskettes costing pennies, who cares if you could squeeze one extra program onto a disc compared with the hassle of having to pack them all on a system without a hard drive?

I'm not suggesting you're somehow wrong, that's just my opinion.

>....On tape recorders you also save time, since the loading
>of a packed program does not take so long....

I found tape storage to be worse than useless on all the early computer systems I owned/used before the Atari (RML-380Z, ZX-80, ZX-81, Apple][, VIC-20 etc) so I bought an 810 within the first couple of months of getting my 400 and retired the 410 permanently.

Though I *DO* take your point....in fact, I wrote what I suppose could be called a "packer" to speed up the loading of the "Mercenary" loading screen off of tape (simple RLL coding based on an article I read in "Page 6" or "Atari User" ISTR).

First bit of coding I ever got paid for.

TTFN - Pete.

Hi,

> And as a bonus: Packed software is more difficult to hack. It
>doesn't cause a real hacker too much headaches....

As I can testify....it's usually a piece of cake to modify the loader
program to simply load the data into memory and return control to the user
(or dump it to a disc file automatically if you really want to be cocky).

Ah, the Atari Assembler/Editor cartridge has a lot to answer for.... ;-)

Never really considered the packing aspect though - I just looked on it as a
(ridiculously easy to circumvent) method of copy protection.

TTFN - Pete (aka "Ensor - The Software Worm" (amongst others)).

Hmmm, I think there were 3 games in total. There was also an
addon disk which as far as I can remember was crap - the only real
difference was that the background colour was now magenta and the
underground mazes were different.

I can't remember the names of the followups right now, but I'm
pretty sure they didn't come out on the 8bit, but rather the ST and
Amiga.

I think both ways involved this ship. Didn't you have to collect
engine parts or something? I was always quite suspicious about a
strange looking structure to the North of the city. It seemed to have
some strange function and I was sure it was connected to the third
escape solution........

I was wondering if anyone could help, my first ever computer was a Atari 800 and there was a game which i use to play alot and i'm tying to find the name of it. It was a kind of platform game where you take control of a little man and you had to take him around each of the rooms in the house to get a key, so you can move to the next level,

If you could help please could you email me the name of that game to:

CyberSurferUK@aol.com

Hi everyone,
I have a couple of Atari 2600 carts up on eBay right now...

Pal versions of rare games -

Klax, fully boxed with instructions,
Xenophobe, fully boxed with instructions,
Xenophobe unboxed

All with a low starting bid, and BIN, so add these great games to your collection!

Have a look...

Pete wrote

: > And as a bonus: Packed software is more difficult to hack. It
: >doesn't cause a real hacker too much headaches....

: As I can testify....it's usually a piece of cake to modify the loader

That's what I said. Some people call themselves a hacker while they only are able to use a sectoreditor with INT / ATASCII support, which won't do with a packed program.

: program to simply load the data into memory and return control to the user
: (or dump it to a disc file automatically if you really want to be cocky).

That's true. If it's a file, the only important thing you have to do is to redirect the "exit-depacker-routine" to your own one, be it the DOS commandline or a "write-to-disk" utility...

: Ah, the Atari Assembler/Editor cartridge has a lot to answer for.... ;-)
:
: Never really considered the packing aspect though - I just looked on it as a
: (ridiculously easy to circumvent) method of copy protection.

Some packers are tricky, like SFDN or LUFA packer for example, especially when the copy-protection routine is part of the packed data...

So, what about Alternate Reality Online, then? I noticed a "2001" credit on www.aro.com but nothing seems to have changed. I once tried to contact Gary via that site but to no avail. So, PHILIP, if you read this, call that old mate of yours and tell him we're all waiting for some new music (or old music rerecorded, maybe). And of course we're all looking forward to a continuation of AR!

Pete wrote

: > whats the use of any packer ?!? To save space !!

: True, but I really don't see the point on a machine like the Atari.

It's more then usefull on diskmagazines, simply cause there will fit more data
on a disk.
Same with demo's. Sometimes I code a simple small demo/intro, and if there
are some graphics and digitized audio in it, it'll simply not fit on one
diskside, so packing is a nice solution.
Besides of this all, it gives your final executable a bit of a more
professional look (not important, but just as a bonus :-)

: In all the years I was using the various 8-bit machines as my workhorse
: systems I never ran into a situation where a packer would've been of benefit
: to me.

Read above.

: I'm not suggesting you're somehow wrong, that's just my opinion.

You're welcome.

: I found tape storage to be worse than useless on all the early computer
: systems I owned/used

I guess you never used the highspeed datarecorders modified by JRC in Czech
republic? Bohdan Milar showed us how it works on the last UnConventional
party in Germany. Much higher speeds, and filenames like in DOS (o.k. I
admit, C64 also has filenames). A perfect solution for those who didn't have
a diskdrive, and there were a lot of such users over there since diskdrives
were rare in the Czech republik (and Poland and Slovakia) a few years ago...
65

before the Atari (RML-380Z, ZX-80, ZX-81, Apple][,
: VIC-20 etc) so I bought an 810 within the first couple of months of getting
: my 400 and retired the 410 permanently.

I actually wanted an Atari 800XL, but then the news showed up that the 130XE
would be released soon, so I ended up with a 130XE with a 1010 datarecorder.
No money for a diskdrive 'till the next year, so a 1010 is perfect in this
case :-)

I've got it on one of my st's but I never took it seriously other than as a rather buggy curiosity. I had the luck to keep a couple working 8bits around and buy up some things from user group flea markets and also when antic publishing had a clear out saile about a decade ago (right before they went bust). Hence I haven't really used it at all recently

Have you tried it on a PAL system (or do you have one)?

'Making' a PAL system is actually fairly simple, assuming the software doesn't do some kind of "PAL detection" by checking a byte in the OS.

As Nir Dary discovered, you can simply swap a PAL ANTIC in for the NTSC one and voila! Your screen will roll, but something like a Commodore 1902 monitor can fix that easily... Just twiddle the V-Hold knob. Bwhaahahha! :)

Howdy folks

I hope I'm back.
The service I use here at the university of Aachen, Germany have changed a couple of things.

New computers
New software
New server

This means:

No more Netscape
No more WinVN (I have to click on + to see the rest of a threat. How nice.)
Outlook (the virus spreader)
My own test messages to myself still aren't back.
Etc., etc.,etc.

And yes, I can not find the fast 4 weeks of Email. And the SysAdmin is sick.

Can I shoot Bill Gates, please?????

FamilyNet Newsgate

One cute setup I did once was to have a tan 1040ste as the main computer
and as a "8-bit module" had a tan XEGS (the 8-bit game system with detachable
keyboard). They made a nice matched set!

Of course the problem you run into when you have a 8-bit/ ST system and one
without a keyboard attached is that one needs a virtual keyboard or some way to
input text.

I currently have hte reverse setup right now. A Atari 800 with a "890 ST
interface" (which is a 1040STE in a beige computer case). Again 800 XLDJ and
other null modem setups are the call of the day with all this. And again, I
wish there was a virtual keyboard setup (that was mouse operated or something)
that could be used for input on the ST side of things.

Fun hobby isn't it?

LOL, probably just called "Mercenary II"....actually, come to think of
it.... ;-)

>> Wasn't one via a ship located in an underground hangar?

> I think both ways involved this ship. Didn't you have to collect
>engine parts or something?

Hmmmmm, that rings an awfully big bell! I think you're on to something
there....I do know two people who'd probably know for sure, and I've been
meaning to ring one of them for a while - I'll call him tonight and let you
know what he says.

>....I was always quite suspicious about a strange looking
>structure to the North of the city. It seemed to have some
>strange function....

SOMEWHERE I have the "hint pack" which they released to help people complete
the game. If I can't get hold of Martin I'll see if I can dig it up and see
what it says about this - no promises though, I haven't seen it in years.

TTFN - Pete.

Car boot sales...

They RARELY turn up on the London places like Hackney Wick but it's
worth a look.

Only other place to try is the retro shop in Computer Exchange,
Rathbone place, off Tottenham Crt Road in London.

They get them in there from time to time but again not that often..

Give em a bell...

It's people like yourself that I'd like to see get an APE cable. You
probably have a great load of UK bits and other UK hacks (hell, even a
few by me :-) maybe) which won't be found elsewhere.

If you ever get a chance then get an APE cable and archive your
collection please :-)

OK, I may consider this... is it easy? cheap?

From what I have seen of Atari emulators, they do not seem to emulate these warp-speed double density disks? If I transferred them over, would the emulator read them?

When I was younger, I went through and sorted out all my multiboot games into alphabetical order... took weeks of copying back and forth... worth it though, I've got them all on warp speed double density disks...about 100 of them...

So, who were you then on the Atari scene? Kent Team? Rob C? heheh.... Rob C was a legend... :)

The cable is a mere couple of quid to make although I didn't make one
myself but know the component prices.

>From what I have seen of Atari emulators, they do not seem to emulate these

Not sure, I can't see why not tho...The emulated hardware code seems
pretty tight.

I just collected, the idea of sorting all the disks out was too vast
an idea to entertain :-)

>So, who were you then on the Atari scene? Kent Team? Rob C? heheh.... Rob C

>
Ha ha....You would be stunned how close knit most were.

Me, I used 'Mole-eater' as a name and there's a big lump of trained
games by me out there and the odd nice hack Like Sidewinder / Raid
over Libya.

As for the UK hackers society...Well a couple of us used to chat with
Rob via 300baud modems and transfer files. That's how I got Buck
Rogers. The other bloke who chatted to him was the 1st bloke to be
taken to court in the UK for piracy by Atari, the daft idiot was
selling cartridge games on disk via Exchange & Mart when he was paid a
visit by Mike Wilding's lot from Atari.

The case was settled out of court which was a result for him but
making money from it was a amazingly stupid thing to be doing!!

I know a couple of the Kent team, a certain 'copy' of the 1050 Happy board came via them (forgot the name they called it). Infact I worked for one of the Kent team a while ago, his hacking days are long over :-)

If you ever saw an Electronic Arts crack then it almost certainly came from a guy called The Mole, he was / is a top Doctor these days and hacked stuff for fun while his mate made the fancy OS replacement board as sold by Computer House back then.

Like I said, we all knew each other to varying degree's

Hi,

I am developing ConGo, an 8bit picture viewer and converter for Win. It already knows a lot of Commodore 64 and Sinclair Spectrum graphic files but what I'm missing are informations on the Atari graphic specs. I looked into the FAQ but found none. What I am interested in is:
- how are the bitmaps and colors/palettes organized on screen and in files (most important formats)
- RGB values of Atari colors
- existing image converters Atari<->PC which could help me

Thanks for any hints...
Matthias

My first computer to play with was the Sol Terminal 20 by Pro-Tech (Professional Technology) with the North Star disk operating system running C/PM in 1977.
Of course I was five at the time, so the only thing I cared about on my dad's computer was that it had a star trek game and a "Targ" game. Both are very good to this day and no computer has matched such fun games using no more than simple text.

(For the Sol Terminal 20 emulator and a good screen shot of "Targ" you find them at...

http://www.thebattles.net/sol20/solace/solace.html

... a great emulator for the PC! Trek 80 is simply a blast).

I would pick up a Atari 400 in 1981 after selling my Atari 2600. I was going to get a Colecovision, but saw a friend with a Atari 800 and was hooked. Unfortunately a Atari 800 was a bit out of my price range, so I opted for the smaller brother.
Star Raiders, a Basic cart... both of which dug out of the Atari trash, were my first cartridges.
In time the 1010 cassette drive was replaced with a double floppy percom drive system. The 1030 modem was replaced with a hayes 1200 and then 2400 buad modems. And the computer itself was upgraded (actually very quickly) from 16K to 48K. Later we would add a 1400 XL keyboard from Radio Shack to the Atari 400 to replace the membrane keyboard.

I use a Atari 800 now. (A leftover dream from those early days) However the Franken400 is still completely operational if I ever decide to use it again. Needlesstosay, it sits in a place of honor. After all, it did survive being used from 1981-1989 (everyday use) and then 1990-1999 of occational game playing.

The Atari 400/800 computers... my favorite of them all!

I can get these built in the UK as we've made
master PCBs for both the SIO2PC and 10502PC cables.
The units themselves are boxed and run via a PP3
battery and have an on/off switch.

Basically if people send me an SIO cable and costs
(which I'll work out tonight) then we'll have a lot
more happy A8 users (and emulator users ;-) out there!

Regards,

Mark

6157. Can somebody help...

(active)

==========
.O.S. NET SYSTEM
Xenia Research
P.O. Box 4675
Federal Way, WA 98003
CompuServe ID: 71310,605
$189, 128K disk
Review by Matthew Ratcliff

P.O.S. Net stands for Point of Sale Network, a computer-based sales system
designed to help run a small business by combining elements of a cash
register with inventory and accounting. The complete P.O.S. Net package
($189) includes two software products and a bar code reader for data entry.
However, the elements of the package are available in various combinations
from manufacturer Scot McGowan's Xenia Research.

In its simplest $69 form, P.O.S. can be used as a cash register. One of the
pins on an Atari joystick port can be used with the software to control a
cash drawer that's also available from Xenia Research.

We were not able to fully set up a business to test run the software in
depth, but the demonstration program that came with our review copy was
quite impressive. The documentation is a little difficult to follow,
presented in a set of five small booklets. A single volume with table of
contents and index would have been preferable.

The software includes a preconfigured database with fields for a four-digit
item number, product description, quantity, and cost per item. Sales tax may
be specified by the user, after which it is calculated automatically for all
sales. Some items may be designated as tax-free, such as newspapers or
medicine. Tax laws vary from state to state, and the ability to control this
automatically from P.O.S. Net is a very useful feature.

If you do not recall an item's product number, P.O.S. Net will search its database for the name you specify. After the sale, quantity is automatically updated.

With the bar code handler/reader you can print your own descriptive labels for your products along with a bar code and product number. Then you just run the bar code reader across the label to enter the sale in an instant. I found that the bar code reader worked quite well, even on bar codes made with a faded printer ribbon.

An Atari CX-85 keypad comes with the package. It serves to enhance the speed of data entry, and also as copy protection for the software. You can back up the program disks, but P.O. S. Net will not run unless the keypad is plugged into the machine.

The customer's name, address, and phone may also be entered as part of the sale. The customer information is not part of the database, however.

A report generator is available from the management menu. Here all outof-stock or low-stock items may be listed or printed, resulting in a complete order summary. The report generator may also be used to print a catalog of your product line, by item number or alphabetized item names.

The reports may be used to track the sales rate of a particular item or even the sales performance of an employee, since an employee number may be associated with each sale if desired. These reports are protected by a security code access, so the boss can protect sensitive data.

P.O.S. Net supports up to seven additional terminals which are connected to the host computer through the Micronet adapter from Supra (not included with P.O.S. Net). This box allows multiple Atari computers to share the same set of peripherals automatically (no manual switching required).

The porting effort for the TCP/IP stack is rather small, since it is written in C and ~97% of the C64 main program would also run on an Atari. The one major thing that is currently missing for an Atari version is the RS232 library for cc65/Atari.

Easiest way would be to plug in a BASIC cart and
? FREE(0)

If it is about 30k, it has been expanded.

There are left handed ways of doing it. If it has a disk drive/SIO2PC cable
you could try and load something that goes into the $8000-$BFFF region and
see if it crashed the thing. Just get a cracked cart or BASIC or ASM/ED
image.

According to "Mapping the Atari", you can PEEK(740)/4 to find out how many 1K blocks the computer has. PEEK(106) will accomplish the same thing - just be sure to do it before running any programs as these values can be altered by the software (tell the computer you have less memory, then store data in the "disappeared" memory).

I checked the other day to find the programmer of the 1986 program Cap'n Magneto and managed to find it's creator "Al Evans". (Currently selling PC programs and selling folk music. :))

Anyway, my suggestion, which I will try as well.. is to take the name and enter into a search engine like google. Enter it in quotes like "Al Evans". You will get a few answers, one might be the person you are looking for. Never know until you ask.

Take care and happy hunting. I'll give it a try myself.

Hi,

Here some info about the CS8900A ethernet interface. Look at:

http://www.embeddedether.net/

>The Crystal part also operates in this mode but also has an 8 bit mode
allowing it to interface to microcontrollers with a >minimum of I/O
capacity. The board design further minimizes the I/O needed and requires
only 16 I/O pins. A 4-bit address >bus, 8-bit data bus, and 4 control
signals (/RD, /WR, /AEN, and INTR) are all thats needed to control the board
and >communicate on the ethernet.

http://www.embeddedethernet.com/

As I can see it's very interested. The is already a uip (micro tcp/ip stack)
written in CC65, it's only 4Kb big!!!. It can be compiled to a normal C64
machine and works with an rs232c interface.

I talked to developer of this stack he told me this: "When it comes to using
uIP with Ethernet, the only thing it lacks so far is an implementation of
the ARP protocol which is responsible to the IP address -> Ethernet address
mapping. I have an experimental version that is somewhat working and a full
version will be avaliable at least in version 1.0."

Micro TCP/IP 4Kb, runs on stock c64...

http://dunkels.com/adam/uip/

Lwip TCP/IP 40Kb full stack runs on stock c64

Cool, all we need is for one of the atari hardware wizards to build us
an atari SIO (or parallel bus) interfaced ethernet card and some
programmers to port the stack.

The uIP stack looks like it doesn't have the capability to build
client applications with yet, just basic server capability.

I'd love to put my atari on my ethernet network just because I could.
An FTP server, client, email client and web browser would be great.

I really don't see this as happening on several levels. Mostly because as a group we are a terminally cheap lot. I still recall one post from someone giving his Atari equipment away and getting a response "I will take it if you pay shipping."

When I was fooling around with SIO2PC designs back ~1990 I remember a guy solicited for the purchase of a cable. I offered to build and ship him one for $15 and he said ~'That's way to much! I was hoping someone wanted to sell a used one for a couple of bucks.'

There are exceptions of course, but I would bet a lot of people would balk at paying more then a couple of bucks for it. Last time I checked, the basic hardware for these type devices came in at around $90 with a developer package ~$150 for the Rabbit Semiconductor one.

To interface this to an Atari would require two chips, something like AND and OR logic chips, and a hood off tap into the buss. This is beyond 3/4s of the Atari users ability. Last time I shipped an Atari computer I got gouged for $30. Figure cost of interface, two way shipping, ethernet chipset, will run about $200.

I think when you also read this:

>The Crystal part also operates in this mode but also has an 8 bit mode
allowing it to interface to microcontrollers with a >minimum of I/O
capacity. The board design further minimizes the I/O needed and requires
only 16 I/O pins. A 4-bit address >bus, 8-bit data bus, and 4 control
signals (/RD, /WR, /AEN, and INTR) are all thats needed to control the board
and >communicate on the ethernet.
http://www.embeddedether.net/

http://www.embeddedethernet.com/

We can think of doing this on the PBI of the XL/XE or maybe build it inside
it's very small.

>The uIP stack looks like it doesn't have the capability to build

Hmm but for a full featured stack there is lwip from the same programmer
which also compiles on a stock c64. I think when we get the hardware to work
an uip we can join the lwip project. The programmer was very interested in
an Atari 8-bit version and want to support it also...

Exactly why I still don't have a black box or MIO! I just network my atari
through modems and telephone line simulators. Good enough for me and I don't
even have to do any soldering. 8-)

Hmm maybe that's thru but there are also people who bought an Black-box like me for over $249 USD with black case and then original HD Backup Pro! $49,95 USD and Taskmaster ROM $49,95 USD and last BBS Pro! 5.0b for about $ 40 USD I think... the total price will beat the price I payed for my 130XE 10

times, these machines we get sometimes for free but I still invest money in it. I am just looking for people who are different and like to build, develop new things this is fun! Just like 1Mb in my 130XE at first I thought I never use it, now it's not enough!

When I mentioned that, I was thinking along the lines of a hobbyist
building one and posting instructions/schematics so the rest of us
dumber hobbyists could build it too.

The only reason I really got interested in my old atari equipment
again is for hacking around inside the case! I even bought three more
atari 8-bits so I could hack in some cool stuff. An ethernet card is
high on my list of cool things to put in the box.

I agree that no one is going to get rich by selling ethernet adapters
for atari computers though, it'll be a hobbyist that does it.

the 40k one? That's quite a bit of the memory used up.

Surfing the uIP page leads you to a page about an atari tcp/ip stack
<something>ICE. Sounds interesting as it supports PPP and dialup.
Still, an ethernet connection direct to the atari would be the best
way to go.

Matthias Matting <matting@matting.de> wrote:
<snip>
: - how are the bitmaps and colors/palettes organized on screen and in files
: (most important formats)

The most typical image formats used for distributing pictures were the
MicroPainter and Koala formats. These were RLE-encoded or something.
I'm sure you'll get a detailed answer soon. :)

Resolution was 160x192 with 4 colors (out of the hardware palette of 128
possible)

Raw dump formats were just ~8K of pixel data (no RLE or other compression),
with the four colors arranged in this way:

Background (for "00" pixels) (aka shadow register @ addr 712 (decimal))
Playfield 1 (for "01" pixels) (aka shadow register @ addr 708)
Playfield 2 (for "10" pixels) (709)
Playfield 3 (for "11" pixels) (710)

Each of these is one byte, corresponding to the standard color palette
values. eg:

HHHHLLL0 (Low nybble is decimal 0, 2, 4, 6, 8, 12, 14 for the brightness.
Odd numbers, unfortunately, correspond to the next lower
even number... so a brightness of 3 is the same as 2)

(High nybble represents one of the 16 hues, with 0000 being grey)

Whew!

: - RGB values of Atari colors

Emulators have these, somewhere. :) Check the source for Atari800(Win).

They are pretty well thought of in the microcontroller and DSP groups. A
little over sensitive at times, but everyone likes their hardware and
price:performance ratio for their stuff.

Just make sure you never say something like "That isn't ansi C" or "You
should have done 'XYZ' different" in their presence.<grin>

There really is a threshold problem when you get into the hobbyist skill
range. I put the failure rate at making the MAX232 version of the SIO2PC
cable at about 70% from the number of people asking why theirs didn't work
in the newsgroup.

Practically anyone can do up to 14 pins and maybe 2-3 passive devices. Soon
as you get to 20 pins and a handful of componets it drops dramatically. You
need the AND and OR gates to decode the !R and !W of the Intel style buss
which puts you at 2 chips and 24 pins right there. That is assuming you just
pull a !CS off the existing 74LS138 in the existing Atari in the $D600 or
$D700 page.

It may sound trivial to you or I, but to most people it arcane magic.
>

Getting hardware netted/on the www was really big before the .bomb crash.
Someone managed to hook up an 8 pin PIC as a web server via Linux and a SLIP
connection to it. Only had something like 800 bytes of ROM and something
like a 32k serial EEPROM for storing web pages.

Also a couple of hackers got an AVR micro interfaced to an 8 bit ISA
ethernet card.

Is there a reason why an ether network makes more sense then SLIP? I mean
you are rate limited by what the Atari can handle anyway to maybe ~28k baud.
If it is just because it would be cool, that is reason enough.

6181. schematics for 130XE and 600XL - where to find?

Dailup is nice, but lot's of people get ADSL of cable internet at home and
they use a modem that connects to an ethernet card. When I have an atari
8-bit witrh tcp/ip and ethernet I can connect it to my hub and transfer data
between every computer on the network. Also I can go to the internet thru my
proxy server...

You could try looking at a8jdpeg, the JPEG viewer for Atari 8-bits:
http://a8jdpeg.atari.org

The source code (in 6502 assembler) is available on that page. If you
look at the a8jdpeg.asm file there is code in there that will convert
a series of 320x8 buffers of pixels into either MicroPainter or HIP
format. The drawback is that at the moment it will only do greyscale
images (the buffer has 1 byte of luminance data per pixel), so it may
or may not be useful to you. I'm working on a colour version, but
other things keep on getting in the way.

2

IIRC, the C64 RS232 device was built in. If you were to go about debugging it, it should be with the RVerter device handler. That way it would be mostly compatible with the 850 and SIO2PC cable.

tunslip is not needed, it's a helper program for the Unix side. So (as I said before in another post) all that's missing is a RS232 library for cc65/Atari that is compatible with the existing one. Having such a library, the Atari web server may be compiled from the same sources as the C64 one, and any improvements will work for both. That's the miracle of portability:-)

Well... there actually WAS a version of Archon for the PC in the '80s,
but it was horrible (using CGA graphics). I think it was something like
32K long. You may find it in abandonware sites.

Then there was Archon Ultra... something a la Battle Chess. I frankly
prefer the original.

Let's hope this one recaptrues the feeling!

What do you mean at last? That site has been there for months, and there is still no download! I thought you were referring to "at last" meaning that it was finally available to download. Imagine how stupid I would look if i posted "At Last XXXX Website" to every relevant newsgroup when I discovered a new website.

Howdy folks

I'm gonna place the latest version of CD audio player for the BlackBox in alt.binaries.atari

Including a DOC file.
You'll need TurboBASIC and the BlackBox ASPI manager to use them. You can find the ASPI manager at Tom Hunt's site (sorry, forgot the address.)

If you wanna read DATA CD's try DAT.5 it's a very limited utility (I just stripped CDAP of what we don't need for data and added ONE command and changed the main routine) and you're gonna have to be patient. It takes ages to copy almost 2400 bytes per sector to screen in TurboBASIC. And most data CD's seem to start with a lot of zero's (and I really mean A LOT OF THEM).

No, I'm not promissing that I will update or refine DAT.xxx
(CDAP will be updated)

DAT was flung together to show how easy it is to read data from a data CD.

.!

I&#65533;m looking for a game which might be similar in style to Spy vs Spy (1),
i.e. with many rooms and such. It was published in a German magazine (either
Homecomputer or Computronic ca. 1985) and was in three parts, the first
being the font, the second some machine code or vice versa, the third the
Basic-program itself.

The listing was quite boring, you know, like DATA 255,255,... ..., and came
with no checksummer at all so I never managed to type that one in correctly.

Does anyone know what that game was called? And does anyone have an image of
it? I mean, it&#65533;s about time for me to play it, innit?! (-:

Well,
it was an Oliver Cyranka Game called "agent 08/15", I have the game at home. It is quite boring, since it takes ages to initialize the endless basic data lines and it is only for one player. Imagine a Spy vs Spy game without any opponent (computer or human) - really boring... And it does not include any extras, like the spy vs. spy games, just almost the same graphics as Spy vs. Spy 1 (you have the rooms and the black spy). All you have to do, is walk around and collect approx. 5 items without dying/exploding... -Andreas.

P.S.: As always - email me, if you are interested in this basic game (maybe someone can convert the basic listing to Assembler, since more than 50% are just data lines...)

P.P.S.: Other O.Cyranka games: Break it, a great Breakout clone, Super Dash, a great Boulder dash clone and lots of other game clones (try also searching for Frank T. Wittenmayer if you need good game-clones!)...

> Same with demo's.....
>....digitized audio in it, it'll simply not fit on one diskside....

Excellent points, ones which I'd completely failed to consider.

I don't actually recall there being any disc based magazines over here in the UK back when I was using my Ataris "in anger" (I switched to mainly using the ST in 1986), nor was there any "demo" scene that I knew of.

The latter was quite a surprise since the C-64 was well served by demo coders back then - I probably had tens of discs full of C-64 demos but nothing at all for the A8. :-(

Obviously there were the discs which came with "Antic" and "ANALOG", but for some reason none of the shops I was buying the magazines from bothered importing the discs.

> I found tape storage to be worse than useless on all the early
>computer systems I owned/used
>
> I guess you never used the highspeed datarecorders modified by JRC
>in Czech republic?

No, after my experiences with tape loading on several other machines in those days (most notably the ZX-80/81) and the 410 (which was MUCH more reliable, but slow) I went and bought an 810 as soon as I was able to - I recall spending most of a term's grant on my first one!

The high-speed tape drives were just starting to appear when I was switching over to the ST so I never paid them much heed. I do recall one though that was some sort of upgrade board which fitted inside either the 410 or the 1010 (I forget which), but that's all I remember. :-(

>....A perfect solution for those who didn't have a diskdrive, and
>there were a lot of such users over there since diskdrives were rare
>in the Czech republik (and Poland and Slovakia) a few years ago...

Absolutely.

> I actually wanted an Atari 800XL, but then the news showed up that
>the 130XE would be released soon, so I ended up with a 130XE....

My favourite machine was the venerable 800, closely followed by the 800XL. I did consider the 130XE, but I hated the keyboard (I'm rather fussy about my keyboards, having had to put up with those of the ZX-80 & 81 (I even replaced the one on my 400 with an "InHome" model shortly after buying it)) so never bought one.

Excellent machine otherwise though IMHO!

TTFN - Pete.

Porting uIP to the Atari requires writing rs232 module for the Atari that
mimics the
one for the Commodore 64. Last night I coded up maybe 3/4ths of it, but
won't be
able to work on it more until Monday. I was shooting to make it work almost
exactly like the commodore version. I am sure others are doing or have
worked
on that part also. The rs232_dev.c file for uIP, will need a little porting
for the Atari
which is mostly just getting a timer interrupt going to update a timer.

uIP essentially gives control to your code anytime it gets a packet or at a
periodic
interval (200ms I think). It is micro in one respect in that you have to
handle
retransmission of TCP packets in your code although it will tell you when to
resend.

I wont be able to ever do any testing unless I can figure out in a
reasonable period of
time how to get a SLIP connection between the Atari and PC. I have an
interface and
null modem cables but would need to know how to do that in Windows 98SE or
would need to know step by step how to set that up in Linux which I could
put on
an old PC I have here. (Using Windows would be preferred though --ugh).

After getting it working then on to graft some PPP routines in so it can get
to the internet
with a modem without any help from another computer.

Well, IMO there are some people who deserve worse than that. I'd be
a hypocrite if I were to say I would drop any tears for them. That doesn't
mean I'd be trying to make it happen - I'm no criminal.

I have linux and am willing to test this for you (I am sure other do and are
willing
as well :)

Also, I have information on floppy firewall for testing ppp. No need to
install a
full linux distribution, just create a floppy and boot your PC. I am working
on
configuring this to work with SLIP. Take a look here:

The next uIP version will use the clock() function instead of an interrupt, so the rs232_dev file should be fully portable without any changes, provided that the rs232 functions are available.

: Rick Cortese wrote in message ...

: >I really don't see this as happening on several levels. Mostly because as a
: >group we are a terminally cheap lot.

: Exactly why I still don't have a black box or MIO!

(don't take this to personal. it's ment to be a general msg)

It all depends on the persons priorities. Some years ago I spend a lot of
bucks for both my new Black-Box' and 676Mb SCSI harddrives, but I'll not
invest that amount of money into a Pentium system. Why? I use the Pentium to
have acces to the internet to keep in touch with other 8-bit users. I don't
need a high-end PC to do that. An old used $125,- system will do the job.
And yes, I'm also a registered user of A.P.E (dos), but a SIO-2-PC interface
set-up will never beat a BlackBox (or MIO or what) as talking about speed and
ease of use. Starting Sparta-Dos from a BlackBox partition takes about 2
seconds. How long does it take to just start-up the O.S. of "your" emulated
diskdrives?

Why do people buy an expensive big harddisk for their PC system to store some
extra ATR images on it while they can order a BlackBox and a small harddisk
for less money?
Why do people upgrade their PC's for outrages prices to be able to run
emulators while the real hardware is even cheaper then a regular PC soundcard?
Why do people claim they are real Atari 8-bit fans, but don't have the space
to set-up two computers. They seem to be a much bigger PC fan, since the
Atari system is the one that has to move....

I don't mind if I have to invest some money to have an Ethernet-connection
that I can connect to my network hub which is connected to the internet by a
cable-modem. Why? Because it will be used, and for me it's not that weird if
I have to pay money if I want to have something.

Just my 2 cents. There may be people who disagree with my opinion. Well, so
be it... It's just my own personal opinion...

I wass going to threaten Mr. Gates by emailing him a link to the
Atari Microsoft Basic I'm working on adding to my webpage. Free for all to
download! Let's see how far he'll go.

The best way that I know is to load in a game that requires more than
16k. Believe me, if there is not enough memory, you will know.

The disk probably just soiled the read/write head in each 1050. You
will need to open the drive and clean the read-write head with a
cotton swab and some rubbing alcohol.

The read/write head faces upwards. The pressure pad should be left
alone. I copied a bunch of stuff off of some old moldy diskettes and
had to do so with the drive open - cleaning it every 2-3 disks.

A standard Atari 9VAC power supply (800, 810, 1050) will work fine
with the Rana 1000. That's how mine's been powered since I got the
drive used 15+ years ago!

I agree, I to bought a Blacbox and 2 MIO and the Multiplexer and ran a
super Pro BBS Multi-line. I also have the SIO2PC hook up as well, so all
my 8bit Atari are Networked to each other and a PC. The Speed you Get
from the PBI and cartridge port (multi-plexer) is DMA. The SIO will never be
that fast. It would be nice to see a cheap networking device that would
let multi 8bits network threw the Joystick ports for file sharing and
message chat. But for true 8bit power you need the Black Box, MIO, and
Multi-plexer.

Hi,

> My first computer to play with was the Sol Terminal 20 by Pro-Tech
>(Professional Technology) with the North Star disk operating system
>running C/PM in 1977.

Nice, I've only ever seen pictures of those....

First "computer" I ever used was the Data Dynamics KSR-33 teletype terminal at school in '78 - spent MANY an hour playing Star Trek, Wumpus and Adventure via the attached mainframe some miles away.

Wasn't until 1981 that we got the RML-380Z upgraded to a disc based CP/M-80 system, we were stuck with dual tape recorders until then.... :-(

TTFN - Pete.

What where the extra features in version 5? I read in the Black-box manual about version 4.6 that would support 48 Mb partitions, it would be great because the Black-box supports 18-bits which allows you to max. 64Mb partitions, but also this version that would be written by Bob Puff & Charles Marslett was never released I think.

But maybe Charles Marslett can answer this all himself, I hve seen him several times in this newsgroup this year...

> like this cart went bad or am i missing something? (like hotkey
> combination)

No they should work, but I have seen several problems with these old carts.

1) Bad contacts, try to clean the connector.
2) I got a tip, that when you replace the 74xxx chips inside the cartridge
for new once it would be better, because these chip are faster and have
better specs.
It should solve the problem, that the cartridge will lock when
programming. I have this problem myself. I need to replace the chips also.

Try it also on a 800XL, see if it's works...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Howdy Rene, Ron

I've read the same article over and over again. They probably heared one thing and later wrote something completely different. 'Marcelette' looks and soons way to much like 'Marslett' to me. I guess I asked Charles about this. He didn't know about a version 5 at that time.

Back when the article appeared, the BlackBox didn't exist yet. (that is outside Bob Puff's office/brain)

Mathy.
I'm no expert on this. But BASIC moves strings around. That
is why I always do a X=ADR(A$) just before passing the
address of A$, hoping BASIC doesn't move the string.
I've heard this.
Russg

6227. CD audio player version 118

Newsgroup: comp.sys.atari.8bit

Howdy folks

The latest version of my Audio player utility (for people with a BlackBox
and SCSI CD ROM players is available at alt.binaries.atari

(sorry, I wrote about it in a previous message, but I must have mixed up the
cc: field with the subject field)

CU Mathy van Nisselroy

6228. TurboBASIC

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-22 12:26:10 UTC
From: Mathy van Nisselroy <nisse-ma@reze-1.rz.rwth-aachen.de>
Message-ID: <9r1393nor1@nets3.rz.RWTH-Aachen.DE>
Source record: 33549

Howdy folks

A few days ago, while trying to read data CD's, I came upon somethign silly;

Within on PROC I do the following:

I have read sector 16 of the CD (here you find where the directory and stuff
is) and stuffed that into a string calles a$.
Then I display (parts of) a$

The 'problem' occures here: When I RUN the program, the contents of A$ is
where it should be, when I EXECute just the PROCedure, the contents of a$
starts one byte earlier of later (at moments like this I never can remember
if it was one or the other).

Is this a bug in TurboBASIC, normal, a concequence of my programming or
....?
Please 'enlighten' me.

How exactly do you stuff data into A$? If you use "ADR(A$)", you should
remember that TurboBasic might relocate A$ from time to time to make room.
If you pass it to a ML-subroutine, you should take its address as close
as possible to the USR() call, e.g. directly as one of its arguments.

So long,
Thomas

I think that version (4.6) was to be done by Bob Puff alone (I had
lost track of him by then). This is the first I've heard of 5.0 --
perhaps someone else was going to take the 4.53 code we released
and enhace it?

I do doubt it actually was completed, though.

Wouldn't press time for Sep '88 have been before you guys did 4.53; and
maybe before 4.50 itself?

Page 24 of Analog #64 reports only:
"MYDOS 5.0 is a pretty hefty program. In addition to a disk sector editor,
command line interpreter (CLI), and multiple autorun file support, MYDOS
supports many types of disk drives for your XL/XE computer. If you have a
Happy drive, Atrai XF551 or even an ICD hard disk, MYDOS allows you to
create custom disk drivers to operate your drive. MYDOS is density smart."

Basic and TB only move strings when the statement table changes by adding or removing lines; this can occur during immediate mode editing or with that 'dynamic keyboard' POKE 842,13 stuff while running.

If you call a subroutine or procedure from the Ready prompt *after* defining BUFR=ADR(A$), then the location will normally shift a byte or two. Remember that all immediate mode commands (RUN, GOTO 400) are tokenized into the statement table memory as line 32768 before execution and that the program will grow and shrink causing variable storage space to relocate slightly.

Morals:
Define or redefine address variables just before or in the subroutine while debugging.
Do not change your code dynamically after defining all of your variables up at the top.

Is anyone aware of any technical information available about AMSB? I saw from the list of APX programs that there were a couple of APX utilities created for it, but that is pretty much it. I've also read that AMSB was fairly similar to TRS Level II Basic, but no details. For that matter, does anyone know if there are any MSB books for other platforms that would provide insight into the structure of AMSB?
(I have the AMSB I and II manuals, but they provides scant info about the inner workings.)
Thanks,
Larry

I don't have much technical info on it, but it's seriously lame in my opinion. After booting the BASIC disk you're left with only 22K out of 48K RAM to fit a program in. Not only that, but if you were to commercially release a program written in AMSB whoever bought it would have to own a copy to run it. The disk itself is copyprotected and any 'work' disks you use with it have to specially prepared with AMSB to save your work on. I think it was a feeeble attempt by MS to infiltrate the Atari market as they did the TRS-80 market. The manual claims to help you make TRS-80 programs (& others) portable to the Atari, when the reality was everything done on the TRS-80 had already been done on the Atari (usually much better) without MS's help.
Just another MS rant...

Hi, you mean RVerter vs R:R:Connection right? P:R:Connection was an ICD
device with a custom micro in it.

Steve said a SIO2PC works with the R: handler from the R:Verter and
generously gave me a copy of the PD version by Bob Puff IIRC, but I sand
bagged on doing any work with it.

> >fairly often.

It's the hardware upgrade you should buy when you want maximum power of your 8-bit Atari.

1x Printer port interface. Printer spooler which uses 130XE extra memory or you can add 64Kb on the black-box.
1x Rs232c port, up to 19.200 with hardware flow control support.The best rs232c interface around
1x feature connector to add the floppy board, allows you to connect 4 IBM drives and extra functions...
1x SCSI interface, normally SCSI-1 but can be upgraded very easy to support SCSI-2 partity and termination power.

The Black-box supports big harddisk as 1.2 Gb, you can setup 96 partitions and up-to 8 harddisks. Boot from every partition you select.
There are buttons to access the Black-box menu swap drives/partitions and go back and the program doesn't even know it has been interupted. (Works with most software).
I own 2 of them and I can really recommend it.

Look at: http://nleaudio.com/css/ for full manuals and ordering information...

> Are we likely to see a DVD movie player later?
> ;-)

It wouldn't be that much harder.
I don't know DVD players that well, so I don't know if they have a way to
get
a video signal out via another way then the SCSI bus, and if yes, if it's
ready to
be displayed on a TV or monitor, but the part that tells the DVD player what
to display wouldn't be that difficult. And if you wanna use David Deavon's
InfraRed Gateway, you can even use you remote controle.

The only problem with the remote control that I have run into is that the
signals
comming from the remote can vary slightly. David tells me to change the
time
on and time off variables. But I can not find them. So I'm trying to stuff
this
algorithme (AtA)^-1.A into the XE to calculate a vector that, when
multiplied
by the signal comming from the remote gives me an indication of which key on
the remote has been pressed.

BTW I didn't come up with the algorithme myself, somebody from a
num-analysis newsgroup helped me.

Lemme guess.... RUN is 1 toke and EXEC MAIN is 2 tokes and therefore A$ is
shifted by 1 byte.

This is one for the "don't EVER forget that" list.

Thanks!

Howdy folks

I found a couple of bugs (well, Fox-1 did) and fixed them (I hope).

The tray should now close. Mine is slot-in, so I can not test it.

It should now work with CD's with 99 tracks (not just up to 98).

CU Mathy van Nisselroy

PS Tom Hunt if you are reading this, could you please tell me/us where you stuffed the ASPI stuff. I forgot. (and I still don't know where my old messages (the ones I don't delete) go. Stupid Micro$oft.

PPS you need an ASPI manager to use CDAP. The only ASPI manager available at the moment is the BlackBox version. BBAS040.COM

What was it with Analog and MyDOS? In issue 45 (the first one I laid my
hands
on.) they also mention MyDOS as having a CLI.

There is an article about Supra's network thingy somewhere in Analog too.
Can't remember the issue, but it was on the left side and on a light (maybe
even white) background. The interface worked fine (IIRC Matthew Ratcliff
did this test too) as long as each computer was booted one after the other,
but as soon as you tried to boot more then one at the same time, trouble
started.
I believe that was the last I heard of Supra's Network Interface. It used
SIO
by the way. I've thought about contacting Supra about this. But didn't.

Hi,

I am one of the few sysops still running a BBS Pro! on a telephone line, I like to move to telnet but I need some software that can connect two ways.
1) Answering incoming calls
2) Making auto going calls on the internet to another BBS Pro! for networking.

There are a few programs like APE, but you have to set this software to send/recieve mode manually which means it's not that usefull for me. Tom Hunt has written a gateway program, only works with winsock 1 that allows calling to another system just by emulating a modem.

Is there anybody who knows a program or can write one that can do the following:

1) Answer telnet connections from the internet and send a "RING" string to the modem and makes a connection
2) When the atari sends ATDT command it will be followed by the IP adress that's being called, the program has to setup a telnet connection...

Please help!

TXG/MNX

If you try these and they work for your BBS then someone might also want to use it to run an A8 web server. (I know, a bit twisted ;-)) Then they could use the A8 web server software I'm already developing on my version of the emulator. Written in Turbo BASIC and running at http://cth.dtdns.net:81/ It's slow but useful as proof of concept. If anyone expresses an interest then there's lots I could do to make it alot faster.

6261. Help developing Atari 8 on PC

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-24 04:42:09 UTC
From: Mopar Man <nospam@nowhere.com>
Message-ID: <uqgcttk1n72rcsv29o143fmcn4r7vu7045@4ax.com>
Source record: 33584

I'm just now beginning to do some 6502 assembly programming,
and hoping to quickly move to 68000. My current Atari 8-bit machines
include an unmodified 400, two 800XLs, and a 130XE. I have a 410
cassette recorder and a USDoubler 1050 drive. I have not yet made an
SIO2PC cable, but will be doing so in the very near future (I hope).
I have a nice PC setup, and run AtariWin800+. I would love to develop
on the emulator, but I cannot find any native Atari assemblers to run,
and I also cannot find any good info on a PC based 6502 assembler that
I can use.

Since I am just learning 6502, and struggling with the Atari
Assembler/Editor cart, I don't want to have to learn several different
assemblers. Does anybody have suggestions for a decent development
setup? First projects will be small - simple display list setup, P/M
movement, DLI and VBlank code, hopefully moving towards a spiffed up
Pong type game. If I get good enough with the hardware, I may even
try a much simplified version of Plasma Pong (hidden game in the
Jaguar version of Defender 2000).

I really appreciate any help. I've gotten good response from
this NG in the past. Thanks all 8-bitters.

Stephen Anderson

Hmm the best setup for programming would be using the real 130XE with Mac/65
assembler. This is a very powerfull macro assembler. It's available as
cartridge but there is also a diskversion. The manual can be found at:
http://www7.brinkster.com/atari/mac65.htm#topofpage The diskversion can be
downloaded at:
http://www.umich.edu/~archive/atari/8bit/Languages/Assembly/m65v42.zip
There is also a cross assembler for PC that allows you to program in Mac/65
on pc and the output can be run on the 130XE.
http://www.cs.utah.edu/~schmelze/atari/atasm/

But why move the 68000?

> Since I am just learning 6502, and struggling with the Atari

It was Feb '87 #51 for Supra's MicroNet; Matt reported that it could cause havoc if the various users did not monitor possible conflicts from others. A concurrent disk read from one and write from another might collide in a garbled sector.

I never saw a release notice that I remembered.

It looks like the SL Terminal Server can support a single defined
destination for a dial out. See
http://docs.seattlelab.com/slink/Autoconnect_Script.htm .

Best,
Tom

I can load 5200 cartridge images in Atari800Win, and they start the demo
normally, but when I press fire on my joystick or press F4, nothing happens.
How do I start a game?
Also, the ATARI800WIN.HLP file is missing. Should there be one?

Just wondering, as there seem to be loads more Atari 800's on Ebay in the USA....

If I was to get an 800 bought over to the UK, would it work? Are all the power adaptors the same? I guess I would need a "step down" convertor? Would the Atari "RF adaptor" just plug in and go? Would I get a black and white pic? Are the TV-out sockets the same?

Questions questions!

Would
> the Atari "RF adaptor" just plug in and go? Would I get a black and white
> pic? Are the TV-out sockets the same?

The difference between UK & Europe and USA is the television standard. In de
US the use NTSC at 60Hz in Europe we use PAL at 50 Hz.
In europe we have more scan-lines available on each screen but we have each
1/50th second an vertical blank interupt. In de USA they have less
scan-lines but more interupts 1/60th of a second. Rebuilding a NTSC machine
to PAL is not easy. But to make it usefull you can simply change the ANTIC
chip. This way you will have a system that can be used running PAL software
only monochrome output....
Another solution would be to build a SCART cable and having a television set
that allows NTSC input.
There is also a third standard called SECAM from france, there where even
SECAM 8-bit machines build.

All,
I'm getting in late on this discussion. Am I reading this right?
Ethernet interface for the 8-bit? Cool... How much and where can I get
one. This is the one thing I need to make my old system useful for me
again. I already have a small 10/100 network and adding the 8-bit would
be great for moving all those aging floppies to something more stable
and accessible.
Question, can you boot from the network or would I still need a boot
disk (floppy) or MI/O boot drive (RAM/HD partition)?

I think their web site is something like www.rabbitmicro.com for the one
Bill and I are talking about.

I may have some details wrong, but IIRC they completely reworked the
~8042/8039 type micros that are used in IBM keyboards into a monster.
```

Outlandish performance in the 10s of MHzs and optimized instruction set, huge ROM on chip.

They have a product/demo type device that shows what the thing can do. Pretty much a complete ethernet TCP/IP solution in a credit card sized board. It's been a while since I last looked at it, but I think it has a really simple interface to the host micro. Just something like like 8 data bits and 2-3 control lines. It could pretty much be wired into an Atari or any other micro for that matter. I think it is set up to be as easy to use on a buss as the standard Atari chips like Pokey or PIA.

6282. FS Atari MIO Adapter

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-25 15:50:15 UTC
From: af332@freenet.hamilton.on.ca
Message-ID: <9r9cbnpqn1@mohawk.hwcn.org>

I have an MIO parallel port adapter for the 130 XE

What this does is plugs into the 130 XE port and gives you TWO upgright cart ports. Typically for the Sparta Dos X cart and the Rtime 8 card. If you hate having your 130 XE cart port on an angle, you could use this. I am asking $20 US shipped. If you have lost yours, it is tough to replace.

Email a response.

Willy

rolaid (mikem@netxpress.com) wrote:

: What is a "Black Box"? Sorry to be so dense, but I see it mentioned
: fairly often.

A Black Box is an Atari 8 bit hard disk drive interface that has printer port, (sometimes) ram buffer and modem RS232 connector. It also can be fitted with a Floppy board adaptor to use standard flopyy disk drives such as HD 1.4 drives.

They cost 200 dollars and the floppy board add on is 150 and the case is about 40 cables etc etc.

I am thinking of selling mine, so anyone who has a reasonable offer, email me. I wont be low balled and wont respond to questions of selling the floppy board separately. I wont.

6284. ANNOUNCE: Cleveland Free-Net Atari SIG archive

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-25 15:59:30 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-128123.08593025102001@corp-radius.supernews.com>
Source record: 33505
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari-jaguar,alt.atari-jaguar.discussion,alt.games.lynx

I am proud to announce the launch of the Official Cleveland Free-Net Atari SIG Archive.

http://www.atariarchives.org/cfn/

The Cleveland Free-Net, a free dialup and telnet BBS offered through Case Western Reserve University, was home to an active group of Atari users. The Atari SIG (special interest group) had information about every Atari platform, including 8-bit computers, 16/32-bit computers, Jaguar, Lynx, and Portfolio. The Cleveland Free-Net was shut down on September 30, 1999, but before it was, a complete backup of the Atari SIG was made.

Working with the folks who ran the forum, we have endeavored to preserve both the feel of the SIG and the information it contained. This is an amazing resource that exceeds 200 megabytes of data - much of which isn't available elsewhere.

"The Atari SIGOps hoped to preserve this extensive information resource we had built over the years. We approached www.atariarchives.org and Kevin Savetz with the idea of a permanent web archive of our SIG, and we couldn't be happier with the result." --Michael Current, mcurrent@carleton.edu, former 8-bit Atari SIGOp, Cleveland Free-Net Atari SIG.

Among the highlights:

A Time Capsule of Atari news items from 1986 - 1999
http://www.atariarchives.org/cfn/12/03/

Atari 8-Bit Technical Reference Manual and upgrade guides
http://www.atariarchives.org/cfn/12/02/

664 ST-related newsletters, including Z*NET and ST Report
http://www.atariarchives.org/cfn/06/08/

A complete archive of Z*Magazine
http://www.atariarchives.org/cfn/12/05/02/

Reviews of 79 Lynx games
http://www.atariarchives.org/cfn/08/07/

6290. Anyone have dos xe?

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-26 05:53:44 UTC
From: SoftNGui <softngui@earthlink.net>
Message-ID: <IT6C7.594$Q4.66541@newsread1.prod.itd.earthlink.net>
Source record: 33514

Hi

I'm looking for a copy of dos xe. I don't have any way to transfer to an Atari so if some generous soul could send an Atari-formatted copy please email me for shipping address. Thanks.

Fernando

6291. Re: ANNOUNCE: Cleveland Free-Net Atari SIG archive

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-26 06:09:44 UTC

Message-ID: <MPG.1642c820d163dfaf9896a1@news.nacs.net>
Source record: 33515

Would a word of credit for running the real, complete version of this archive for over 2 years, on my own money and bandwidth, with no banner ads or sales pitches been too much to ask?

Shades of iFilm. Oh well I wish your incomplete yet 'official' archive the best of luck, as of tonight its the only copy.

Over the past few years I gave away about 75 copies of the complete archive to anyone who wanted it free of charge on CDR. Maybe you can track down one of them for a copy of the missing parts.

Steve

6292. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-26 06:26:49 UTC
From: w_a_lang@willinet.net
Message-ID: <tti0gdqtgqp02a@corp.supernews.com>
Source record: 33516

Hello Everybody,

Here is how to tell which Atari Basic Revision that you have:

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

6293. Looking forADVAN BASIC +ADVAN OPTIMIZER

Considering he is an Atari reseller which are FEW AND FAR between, I don't see a problem with it. No-one goes after the ebay auctions or Songbird.

Agreed! And Ben is a nice guy and you can trust him. More than I can say
about some others here.

Archon Ultra was a big disappointment for me - It had so much promise.
Looks like this new version is more of a direct port with a few tweaks
here and there. The Netplay will be nice...

6299. NEED Turbo-816 OS ROM image...

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-26 12:13:47 UTC
From: TXG <txg@the-underground.myweb.nl>
Message-ID: <3bd954c1$0$1533$e4fe514c@newszilla.xs4all.nl>
Source record: 33523

Hi,

I am busy developing a new upgrade the 8-bit computer it would be a replacement for the original CPU with an option to switch back to be 100% compatible. Now I need the ROM of the Turbo-816 because that OS already supports the 816 and can I see if it would work. It runs already with the normal OS and Qmeg.
Alot of software runs on it. I like to use the OS to develop the memory upgrade. The Turbo-816 has already an 16Mb memory test.

If somebody could e-mail me the image of this ROM, or contact me if he has one, or one for sale it would be great. I have software for dumping the OS when you don't have any electronics experience.

Source record: 33524

Can anyone tell me if Activisions 8-bit Kaboom cart will work on the XE systems
or just a straight 400/800? (North American versions)
thanks,
Mark.

http://www.rabbitmicro.com/products/rcm2200/index.html

Is the one I am thinking of. At least I think it is the one I am thinking
of. ~$50 and comes with 256k of FLASH and 128k of RAM.

Some microcontrollers are funny about their RAM access. Can't excute
instructions from RAM or slow down a bunch when they have to access off chip
storage. I'm not sure what their micro is like, but since it seems to be
more Z80/64180 derived then 8039, I'm assuming it doesn't have those
problems.

It would make a nice building block for a project. Something like use the
FLASH and built in serial ports on the board to simulate a SIO2PC/ATR type
boot.
